BRITISH REVIEW,

For OCTOBER, 1791.

SKETCH OF THE LIFE AND CHARACTER OF SOAME JENYNS, Esq.

WITH AN ELEGANT HEAD.

VOL. VII.

BIOGRAPHY when considered pher, whose sole object has been to promote the cause of virtue, and the interests of society, two things intimately connected, is suffered to remain in oblivion. This, however, has a tolerable of the case of uleful and instructive departments has not been the case with the worin literature; but it is much to be thy character whose memoirs form regretted, that many, who under- the subject of the following pages; take this talk, confounding falle with and who, though he neither enreal virtues, bestow encomiums on riched his country by the spoils of actions which instead of meriting the East, nor added to its territorial praise deserve the severest censure. possessions by conquest, has left in Great conquerors and able generals, his writings, and particulary in that whose lives have been uniformly em- part of them which was intended to ployed in shedding human blood, support the Christian religion, a moand laying waste provinces and even nument more durable than the sculpwhole kingdoms, are, therefore, of- tured marble, ornamented with all ten dignified with illustrious titles; its gaudy trophies. The respectaand language is shamefully prostitu- ble editor* to whom he configned ted in conferring posthumous ho-nours on men whole memories ought a desire that he would collect togerather to be execrated, while the ther all his works and superintend humble and benevolent philoso- the publication of them, has paid a just

just tribute to friendship by prefixing to them a well written sketch of his life; and we with great pleafure embrace this opportunity of acknowledging the fource from which we have derived our information.

Soame Jenyns was born at twelve o'clock at night, in Great Ormond Street, in London, in the Year 1703-4. The hour of his birth he used often to mention, observing, in his pleafant manner, that he confidered himself at liberty to chuse his birth day; and that, as he preferred the birth of the year to the day of its death, he had chofen New Year's Day, which in all civilized countries is celebrated as a day of general festivity. He would fay, likewise, that this circumstance attending his birth made him often laugh at the folemn manner in which biographers record the events that happen at the birth of those whose lives they undertake to write; for though he was born in the moment of controversy, yet of all subjects in which the learned engaged that was

to him the most disagreeable.
His father, Sir Roger Jenyns,
Knt. was descended from the an-cient and respectable family of the Jenyns, of Churchill, in Somerset-thire; one of whom, about the middle of the fixteenth century, by an intermarriage with a coheiress of the Rowlet family, became possessed of Sandridge, in the county of Hertford. About the middle of the last century, a younger branch of this family fettled in Cambridgeshire, which county was represented in three parliaments by John, the elder brother of Sir Roger, whose residence in the country was at Ely, in the Isle of Ely, where he spent much of his time in being ferviceable to his neighbours. The mother of our author was one of the daughters of Sir Peter Soame, of Hayden, in the county of Effex, baronet. She was a weman of great beauty, and poffessed an excellent understanding, which she had improved by reading,

much beyond what was the fashion of those times in the education of the daughters of gentlemen. As fhe was well instructed in the principles. of religion, the manifested her belief in them by her life as well as conversation, and these excellent qualities were still hightened by the greatest politeness of manners. Under fuch a mother our author wasbrought up till the time arrived when it was necessary to confign him over to the care of a tutor. In this quality the Rev. Mr. Hill was introduced into the family, and he received his pupil possessed of all that knowledge, and initiated in all those principles of virtue and religion. which at that early period the infant mind is capable of, or ought to receive.

Young Jenyns continued fometime under the care of this gentleman, who taught him the first rudiments of language, and he was afterwards instructed in various branches of knowledge by the Reverend Stephen White, who remained with him till it was necessary to finish his education by removing him to one of the universities. As his father had purchased Bottisham Hall, in the village of Bottisham, where he refided with his family; and as this place was not far distant from Cambridge, he was placed there at St. John's College, into which he was admitted a fellow-commoner in the year 1722, under Dr. Edmondfon, then one of the principal tutors of that college.

While he refided at Cambridge, which he did for nearly three years, except at those times fet apart for vacations, he purfued his studies with great industry and assiduity. His behaviour was most orderly and regular; and the discipline of the eollege was fo far from being difagreeable to his natural inclination, that he was often heard to fay, after he left the university, that he accounted the days he had lived there amongst the happiest of his life.

From the time he left Cambridge his residence, in winter, was in London, and, in the fummer, in his father's family, as long as he lived. His pursuits were chiefly literary; and though his name was not put to his Art of Dancing, published in 1727, and inscribed to Lady Fanny Fielding, yet the author was foon discovered; and that poem was confidered as a happy prelage of what might afterwards be expected from him. Soon after his father's death, at the general election in 1742, he was unanimously chosen one of the members for the county of Cambridge; from which time he fat in parliament till the year 1780, representing, during these thirty-eight years, either the county, or the borough of Cambridge, except for four years, when on the call of a new parliament, in 1754, he was returned for the borough of Dunwich, in Suffolk; but on Lord Dupplin's going up to the house of Lords, he vacated his seat by the acceptance of the Chiltern hundreds, and fucceeded him as representative for the borough of Cambridge. The constant and uniform opinion which those who chose him entertained of his parliamentary conduct, cannot be more strongly evinced than by the unanimity of their choice; for he had only one opposition, and that from electionadventurers, one of whom not long after, as it often happens to the difturbers of established interests, appeared in the Gazette, among the and lift of bankrupts.

In the year 1755, his late Majesty was pleafed to appoint Mr. Jenyns one of the Lords Commissioners of the Board for Trade and Plantations, at which he continued to fit until an alteration was made in its constitution by parliament, and when the bufiness of it was transferred to the great officers of flate, and those who are in the lift of his Majesty's Honourable Privy

:Council.

Mary, the fole daughter of Colonel Soame, of Dereham, in Norfolk, who dying without iffue, he afterwards married Elizabeth, the daughter of Henry Grey, Elq. of Hackney, in the county of Middlefex, who furvived him.-He died of a fever after a few days illness on the 18th day of December, 1787, at his house in Tilney Street, Audley

Square, leaving no iffue.

Mr. Jenyns was a man of great mildness, gentleness, and sweetness of temper, which he manifested to all with whom he had concerns, either in the business of life, or its focial intercourfe. His earnest defire was as far as possible, never to offend any person; and he made fuch allowances, even for those who in their dispositions differed from him, that he was rarely offended with others; of which in a long life he gave many notable instances. He was strict in the performance of religious duties in public, and a constant practifer of them in private, ever professing the greatest veneration for the Church of England and its government, as by law established, though he thought that alterations and amendments might be made in it which would render it more perfect than it is in its prefent state.

In private life he was most amiable and engaging, for he was possessed of a well-informed mind, accompanied by an uncommon vein of the most lively, spirited, and genuine wit, which always flowed very copiously amongst those with whom he converfed; but which was tempered with fuch kindness of nature. that it never was the cause of uneafinels to any one of those among whom he lived. This made his acquaintance much fought after and courted by all those who had a taste for brilliant conversation, being well affured that they would be delighted with it wherever he was; and that though they were not endued with He was twice married, first to the same talent, they never would

be cenfured by him because they

This fo gentle an exertion of fo rare a quality, he not only strictly observed himself, but was always much hurt if he observed the want of it in others; and he confidered every fally of wit, however bright it might be, if it tended to the mortification of those who heard it, as one of its greatest abuses, since he looked upon all pre-eminent gifts of the mind bestowed by nature, as much for the happinels of others as of these who possess them. In his conversation he was so far from recurring to religion or scripture as subjects for his wit, that those who lived most with him could not help observing, that, in his common and unguarded focial hours, he ever firstly abstained from using the name of the Supreme Being, unless when it was rendered necessary by the immediate subject of the conversation.

No person ever felt more for the miseries of others than Mr. Jenyns. No person saw, or more strictly practifed the duty imposed on those who form the superior ranks of life, of endeavouring to reconcile the lower classes to their present condition, by contributing as far as they are able to make them happy; and thereby to cause them to feel their inferiority as little as possible. He was, therefore, most kind and courteous to all below him, not only in his expressions, and in his behaviour, but in affifting them in all their wants and diffresses; ever confidering his poor neighbours, in the country, as parts of his family, and, as fuch entitled to his care and protection.

He spent his summers at his house in the country, refiding there with hospitality to his tenants and neighbours; and never suffered any places at that season, calculated for public diversions to allure him; for he faid, he could at that time, do more good in his own parish than in any other

fituation. He frequently lamented the prevailing fashions of the latter times of his life, which carried gentlemen with their families from London, when it is deferted by all whose absence can be dispensed with, to places far distant from their houses and ancient seats, in the country, and which are opened chiefly for the reception of those who wish to continue scenes of diffipation they have left. Hence it happens, that the money, which should revert to the districts from whence it is received, is turned into a different channel; tenants are deprived of the advantages they are in some degree entitled to from its expenditure among them; hospitality is destroyed, and the stream of charity, that would otherwise have gladdened the hearts of their poor neighbours is stopped; their inferiors are deprived of their example, encouragement, and protection in the practice of religion and virtue; and the manners of the country are altered for the worfe, which necessarily occasions great mischief to the public.

Such was Mr. Jenyns in his private walk of life, and the principles on which that conduct was founded, when expanded as motives for his public character in a larger sphere of action, rendered him equally praife-worthy. When he was in the country he constantly acted as a magistrate in his own district, and attended all those meetings which were holden for the purpose of public justice. From the general opinion entertained of his inflexible integrity and superior understanding, he was much reforted to in that character at home. From his natural fagacity, quick difcernment, and long experience on hearing and examining the parties, he feldom failed of obtaining a complete knowledge of the cases that came before him; and he was thereby enabled to determine according to the rules of strict justice, always giving his rea-

fans for what he did with a clearnefs and perspicuity peculiar to himfelf, and exprelling those reasons in words fo accommodated to the understandings of all who heard him, that few or none departed diffatisfied with his decisions. When in the course of conversation, among other topics which arole, the duty of a magistrate had its place, and the pains attending it, as also the difficulties from the number and variety of powers with which the legislaturehad entrusted him, were afferted, he used to say, that he thought himfelf fingularly happy, that on a recollection of the many years he had acted in the commission of the peace, he had never been called to the Court of King's Bench to account for his not understanding an act of parliament, of which he was often one of the makers, though this had happened fometimes to people in his fituation; and that he had been amply compensated for the pains he had taken, and the difficulties he had met with during his long exercise of that civil office, by the many opportunities with which he had been gratified of reconciling those who came before him, inflamed with the highest degree of hatred to each other; for he confidered that beatitude which is pronounced on the peace-makers as an estential part of the internal evidence of the truth of the Christian religion.

.

From having long had a feat at the board of trade, and constantly attending his duty there, Mr. Jenyns gained a knowledge of the great outlines of the commercial interests of his country; and though he never employed himself in minutely investigating its particular branches, yet, when it became the topic of conversation, he could discourse pertinently upon it, and much to the information of those who were prefent, having never failed to avail himself of the information which was brought to that board by merchants of the first eminence. Though he never published any thing on the fubject, it was an object which engaged much of his attention, and on which he had made up in his mind certain principles: from these he never departed, and those to whom he communicated them thought him in general well warranted in his

opinions.

He always confidered the British empire as enlarged beyond the bounds dictated by found policy; that those parts of it situated beyond the Atlantic Ocean to the west, and beyond the Cape of Good Hope to the east, were at 100 great a distance to be properly governed; that the American colonies were too kindly fostered by the mother country; and that the millions expended in promoting their growth would at least rear them to a height at which they would think themselves entitled to ask for emancipation, an obfervation which he often made before that event happened, and he lived to fee with regret his prophecy accomplished.

He always beheld our conquests in the East-Indies with a real concern, and confidered the great influx of wealth brought from thence into this country by individuals, as an ample revenge for the unjust depredations committed on the territorial possessions of the native princes; ever looking upon those depredations as the most enormous acts of injustice that could be done by one state to another, and that this was heightened by a most flagrant act of ingratitude for the original permission of commercial establishments made on their coasts, in order that trade might be carried on to more advantage. On account of this permission, he thought the natives were entitled to the most perfect amity, and every public focial intercourse shewn to the most favoured nations. Sometimes, he would add, that though Afia in her turn had been often conquered by all who attacked her, yet,

that the wealth brought from thence by the conquerors into their respective dominions, had always introduced with it fo great a luxury, that those virtues by which they became conquerors, were at last enseebled and done away, insomuch that Asia in her turn became the conqueror. He considered the East Indies, and America, as two immense disproportionate wings to the small body of the island, and expressed his fears lest at some time or other they might sly away with the

British empire. As an author, as long as a true stafte for fine writing shall exist, Mr. Jenyns will have a diftinguished place amongst those who have excelled. Whatever he published, whether he sported with his muse, or appeared in the plain garb of profe, was fought after with avidity, and read with pleasure by those who were esteemed the best judges of composition. His poems, some of which he wrote at an early period of life, are on the most pleasing Subjects, and are executed with the warmest animation of fancy, and at the same time great correctness. His wit is pure and brilliant; and his verification mooth and harmonious. In short, those who can relish the chastness of composition, and the elegant ease of Gay, Pope, and Addison, must admire the poetical effusions of this excellent writer, whose genius and taste were truly classical. What can be more natural or better expressed than the following lines in his spoem entitled the Art of Dancing, where he describes the use and importance of the fan :

But let me now my lovely charge remind, Left they, forgetful, leave their fans behind.

Lay not, ye fair, the pretty toy aside,
A roy at once display'd for use and pride;
A wond'rous engine, that, by magic charms,
Cools your own breasts, and ev'ry other's
warms.

What daring bard shall e'er attempt to tell
The pow'rs that in this little weapon dwell?
What verse can e'er ex plain its various parts,
Its numerous uses, motions, charms, and
arts?

Its painted folds, that oft extended wide, Th' afflicted fair-one's blubber'd beauties hide,

When fecret forrows her fad bosom fill,
If STRETHON is unkind, or SHOCK is III:
Its ficks, on which her eyes dejected pore,
And pointing fingers number o'er and o'er,
When the kind virgin burns with fecret
shame,

Dies to consent, yet sears to own her same; Its shake triumphant, its victorious clap, Its angry slutter, and its wanton tap?

The concluding lines of this poem display also much neatness and animation.

And now the work completely finish'd lies, Which the devouring teeth of time defies: Whilt birds in air, or fish in freams we find.

Or damfels fret with aged partners join'd.
As long as nymphs shall, with attentive ear,
A fiddle rather than a fermon hear;
So long the brightest eyes shall oft peruse
These useful lines of my instructive muse;
Each belle shall wear them wrote upon her

And each bright beaushall read them-if he can.

He wonderfully excelled in burlesque imitations of the ancient poets, by applying their thoughts to modern times and circumstances; which might well be expected after his short but excellent strictures on this manner of writing, prefixed to his imitations of the first epiftle of the second book of Horace's Epifles. inscribed to the Lord Chancellor Hardwick. For many years before he died, he had bid farewell to his muse, and in the language of Lord Bacon, applied himself to such subjects as come home, if not to men's business, yet close to their bosoms; but long as the parting had been, impelled by affection, he again courted his muse, when almost in the last stage of his life. The fincere respect which he entertained for his Majesty, produced a short poem on his escape from the dangerous attack of a maniac, in which it, however, appears, that when compared with his early poems, the fun of his imagination was at that time almost set, though age had net in the least degree chilled in his heart the effusion of benevolence and affection.

As

As a writer of profe, whoever will examine his stile, will find that he is intitled to a place amongst the purest and correctest writers of the English language. He always puts proper words in proper places, and hath at the fame time, a variety in different members of his periods, which would otherwife tire and difgust the reader with their sameness. His matter is always most pertinent to the subject which he handles; he reasons with closeness and precision, and always by a regular chain of argument arrives at the conclusions which he professes is his design to The Free Inquiry into the establish. Nature and Origin of Evil, was the first of Mr. Jenyns' works on account of which he was attacked. Pamphlets were published, and private letters were addressed to him on that occasion, some of them charged with great acrimony, much abuse, and no small portion of calumny. Having long submitted with filent patience to a treatment which he by no means deferved, he answered his adversaries, in a preface to the second edition of that work, published some years after the first; and convinced that he had been much misunderstood by those who had written against him, he makes the clearest, the fincerest, and the most liberal declaration of the end proposed by him in that treatile, in the following words:-"That " his intentions were to reconcile the numerous evils fo conspicuous in the creation with the wif-" dom, power, and goodness of the " creator; to shew that no more of "them are admitted by him than * are necessary towards promoting " universal good; and from thence " to persuade men to an entire re-" fignation to his all-wife but in-" comprehensible dispensations. To " afcertain the nature of virtue, " and to enforce the practice of it; "to prove the certainty of a future " state, and the justice of the rewards and punishments that will treatment he received from such

" attend it; to recommend fubmif-" fion to national governments, and conformity to national religions; notwithstanding the evils and de-" feets which must anavoidably adhere to them; and lastly to shew the excellence and credibility of the Christian revelation, to reconcile some of its most abstrufe doctrines with reason, and to anfwer all those objections to its authority which have been drawn from its imperfections and abuses. These, and these only were his " intentions." To the truth of this folernn declaration, all those who knew the great fincerity of the author's heart, from which, on no occasion he was ever known to depart, will readily subscribe their unfeigned affent.

In the fummer of the year 1776, Mr. Jenyns published, A View of the Internal Evidences of the Christian Religion, without his name. The reception that this work met with was fuch as is feldom shewn to the compositions of the most approved writers; it in general gave fatisfaction both to the clergy and the laity; it wastranslated into foreign languages. and in a short time went through three editions, to the last of which. by the advice of his friends, the author put his name. It was written under a full conviction of the truth of the Christian dispensation, and with a fincere zeal for its service. Warmed with the principles it requires, and the duties it commands, the picture he draws of its excellencies is most exact in its outline; the parts are beautifully arranged. and the whole glows with the most animated colouring.

Though this book was attacked, and the author treated with a very unbecoming afperity, by two able writers, yet the number of private letters he received from those on whom the work had that effect his benevolent intention proposed, more than confoled him for the rade

writers. Many of these letters contain acknowledgments from several persons whom this book had led from unbelief to a full conviction of the truths he had endeavoured to establish. They were written with that humility and pious gratitude which the primitive Christians expressed to their instructors, in the wonderful dispensations of the gofpel.

The good effects of this work were not confined to this country. They operated in distant worlds, and did that which, perhaps, neither of those writers who attacked him, though professed servants of Christ, ever accomplished; for it propogated their Master's religion in India, as appears by a letter from thence, in which the writer, confessing his former infidelity, and the pains he had fociety.

long in vain taken, by means of books recommended to him, written on the truth of the Christian religion, to give his affent to it, concludes in thele words: " I eagerly wished to " believe, but could not fatisfactori-" ly. But now, I thank God, Soame " Jenyns' reasons have, I hope, tri-" umphed over all my doubts, and "I have given an unfeigned and " full affent to his three propositions, which in my opinion prove ss all that is wanted to be cleared " up."

The following entry, the original of which may be found in the regiftry of burials in the parish of Bottisham, for the year 1787, while it does honour to the writer of it. expresses, in a few words, the character of this valuable member of

SOAME JENYNS, in the 83d year of his age.

What his literary character was, The world hath already judged for itself ; But it remains for his parish minister to do his duty By declaring,

That while he registers the burial of SOAME JENYNS,

He regrets one of the most amiable of men,

And one of the trueft Christians. To the parish of Bottisham he is an irreparable loss.

He was buried in this church, December 27, near midnight, By William Lort Mansell,* sequestrator;

Who transgreffes the common forms of a Register, Merely because he thinks it to be The most folemn and lasting method of recording to posterity,

That the finest understanding has been united To the best heart.

* Fellow of Trinity College, Cambridge, and public orator of that university.

REFLECTIONS ON THE FORMATION AND DISTRIBUTION OF RICHES.

BY THE LATE MR. TURGOT, SOME TIME INTENDANT OF THE FINANCES OF FRANCE.

(Continued from Page 209)

tween the producers of the commodities

and the confumers.

'n

0 -

đ

d

1-

i

The undertakers either of cultivation or manufacture, draw their advances and profits only from the fale of the fruits of the earth, or the commodities fabricated. It is always the wants and the capacity of the confumer that fets the price on the fale; neither does the confumer want the produce prepared or fitted up at the moment of its crop, or the perfection of the work. However, the undertakers want their stocks immediately and regularly reimburfed, to embark in fresh enterprizes: the manuring and the feed ought to fucceed the crops without interruption. The workmen of a manufacture are unceasingly to be employed in beginning other works in proportion as the first are distributed, and to replace the materials in measure as they are consumed. It would not be adviseable to stop fhort in an enterprize once put in execution, nor is it to be prefumed that they can be begun again at any time. It is then the strictest interest of the undertaker to have his capital quickly reimburfed by the fale of his crops or commodities. On the other hand, it is the confumer's interest to find, when and where he wishes, the things he stands in need of; it would be extremely inconvenient for him to be necessitated to make, at the time of the crop, his provision for the whole course of require long and expensive labours, labours that cannot be undertaken want of. Vor, VII, a roger and was

\$ 66. FOURTH employment of capi- with profit, only on a large quantals, in advances for enterprizes tity of materials, and such as the of commerce. Necessity of the interposi- consumption of a small number of tion of merchants properly so called, be- inhabitants of a limited diffrict, may not be fufficient for the fale of the works of a fingle manufactory. Undertakings of this kind must then necessarily be in a reduced number, at a confiderable diftance from each other, and consequently very distant from the habitations of the greater number of confumers. There is no man, not oppressed under the extremest misery, that is not in a fituation to confume feveral things, which are neither gathered nor fabricated, but in places confiderably distant from him, and not less distant from each other. A perfon that could not procure himfelf the objects of his confumption but in buying it directly from the hand of him that gathers or works it, would be either unprovided with many commodities, or pass his life in wandering after them.

This double interest which the person producing and the confumer have, the former to find a purchaser. the other to find where to purchase, and yet not to waste useful time in expecting a purchaser, or in finding a feller, has given the idea to a third person to stand between the one and the other. And it is the object of the mercantile profession who purchase goods from the hands of the producer, to store them in warehouses, whither the confumer comes to make his purchase. By these means the undertaker, assured of the sale and the re-acquifition of his funds. looks undisturbed and indefatigably a year. Among the objects of usual out for new productions, and the confumption, there are many that confumer finds within his reach and at the same time, the objects he is in

Kk

§ 67. Different orders of merchants. They all agree in purchasing to sell again, and that their traffic is supported by advances which are to revert with a prost, to be engaged in a new enterprize.

From the green-woman who exposes her ware in a market, to the merchants of Nantz or Cadiz, who traffic even to India and America, the possession of a trader, or what is properly called commerce, divides into an infinity of branches, and it may be faid of degrees. Such a trader confines himself to provide one or feveral species of commodities which he fells in his shop to those who chuse; another goes with certain commodities to a place where they are in demand, to bring from thence in exchange such things as are produced there, and are wanted in the place from whence he departed: one makes his exchanges in his neighbourhood, and by himfelf, another by means of correspondents, and by the interpolition of carriers whom he pays, fends and employs from one province to another, from one kingdom to another, from Europe to Afia, and from Afia back to Europe. One fells his merchandize by retail to those who use them, another only fells in large parcels at a time to other traders, who retail them out to the confumers; but all have this in common that they buy to fell again, and that their first purchases are advances, which is returned to them only in course of time. They ought to be returned to them, like those of the cultivators and manufacturers, not only entirely in a certain time to be employed again in new purchases, but also, 1. with an equal revenue to what they could acquire with their capital without any labour; 2. with the wages or value of their labour, of their risk, and of their industry. Without being affured of this return, and of these indispensible profits, no trader would enter into bufinels, nor could any one possibly continue therein; 'tis in this view he governs himfelf in

his purchases, on a calculation le makes of the quantity and the price of things which he can hope to difpose of in a certain time: the retailer learns from experience, by the fuccels of limited trials made with precaution, what is nearly the wants of those confumers who deal with him. The merchant learns from his correspondents of the plenty or fcarcity, and of the price of merchandize in those different countries to which his commerce extends: he directs his speculations accordingly, he fends his goods from the country where they bear a low price to those where they are fold dearer. including an expence of transportation in the calculation of the advances he ought to be reimburfed. Since trade is necessary, and it is impossible to undertake any commerce without advances proportionable to its extent, here we fee another method of employing personal property, a new use that the possessor of a parcel of commodities, referved and accumulated, of a fun of money, in a word, of a capital, may make of it to procure himself subfishence, and to augment, if he can, his riches.

§ 68. The notion of the circulation

of money.

We fee by what has been just now faid, how the cultivation of lands, manufactures of all kinds, and all the branches of trade, depend on a mass of capital, or the accumulation of personal property, which having been at first advanced by the undertakers, in each of these different branches, ought to return to them again every year with a regular profit; that is, the capital to be again inverted, and advanced in the continuation of the same enterprizes, and the profits for the greater or less subsistence of the undertakers. It is this continued advance and return which constitutes what ought to be called the circulation of money: this useful and fruitful circulation, which animates all the labour of fociety, which supports all the motion

and the life of the body politic, and all undertakings as labour and industry. which is with great reason compared to the circulation of the blood in the human body. For if by whatever disorder in the course of the expences of the different orders of fociety, the undertakers cease to draw their advances with fuch profit as they have a right to expect, it is evident they will be obliged to reduce their undertakings, that the total of the labour, that of the confumption of the fruits of the earth, that of the productions and of the revenue would be equally diminished; that riches will fucceed to poverty, and that the common workman, ceafing to find employ, will fall into the deepest misery.

\$ 69. All extensive undertakings, particularly these of manufactures and of commerce, must indispensably be very confined, before the introduction of gold

and filver in trade.

It is almost unnecessary to remark that undertakings of all kinds, but especially those of manufacturers, and above all those of commerce, must unavoidably be very confined before the introduction of gold and filver in trade, fince it was almost impossible to accumulate considerable capitals, and yet more difficult to multiply and divide payments as much as is necessary to facilitate and increase the exchanges to that extent, which a spirited commerce and circulation require. The cultivation of the land only may support itself to a certain degree, because the cattle are the principal cause of the advances required therein, and it is very probable there is then no other adventurer in cultivation but the proprietor. As to arts of all kinds, they must necessarily have been in the greatest languor before the introduction of money; they were confined to the coarfest works, for which the proprietors supported the advances by nourishing the workmen, and furnishing them with materials, or they caused them to be made in their own houses by their fervants.

3 70. Capitals being as necessary to

the industrious man shares voluntarily the profit of his enterprize with the owner of the capital, who furnishes him the

funds he is in need of.

Since capitals are the indispenfable foundation of all lucrative enterprizes; fince with money we can furnish means for culture, establish manufactures, raise a commerce, the profits of which being accumulated and frugally laid up, will become a new capital; fince, in a word, money is the principal means to beget money, those who with industry and the love of labour are destitute of capital, and have not fufficient for the undertaking they wish to embark in, have no difficulty in refolving to give up to the proprietors of fuch capital or money, who are willing to trust them, a portion of the profits which they are in expectation of gaining over and above their advances.

71. Fifth employment of capitals, lending on interest; nature of a loan.

The possessors of money balance the risk their capital may run, if the enterprize does not fucceed, with the advantage of enjoying a constant profit without toil; and regulate themselves thereby, to require more or less profit or interest for their money, or to confent to lend it for fuch an interest as the borrower offers. Here another opportunity opens to the possessor of money, viz. lending on interest, or the commerce of money. Let no one mikake me here, lending on interest is only a trade in which the lender is a man who fells the use of his money, and the borrower one who buys; precifely the same as the proprietor of an estate, or the person who farms it, buys and fells respectively the use of the hired land. The Latin term for a loan of money on interest, expresses it exactly, usura pecunia, a word which adopted into the French language is become odious, by a confequence of falle ideas being adopted on the interest. of money.

To be continued.)

AC-

ACCOUNT OF A REMARKABLE POISONOUS INSECT FOUND IN SOUTH AMERICA.

N the vallies of the province of its entrance into the blood prevent-Popayan, in South America, the malignity of the poisonous juices contained in their bodies. Among those there is one called Coya, or Coyba, of a fiery red colour, and in fize not much exceeding a common bug. It is generally found under stones, and in the fields amongst the grass and other herbs: when this infect is crushed or burnt upon the skin of any animal, its noxious juices penetrate through the pores of the animal, mix with its blood and humours, and immediately produce a very formidable swelling; the consequence of which is, that if no remedy be applied death enfues in a very fhort time. The only remedy is to take the stalks or dried stems of a particular species of plant which grows in those vallies, to fet them on fire, and to finge the patient's body all over with them as foon as it begins to swell, an operation which the Indians in those parts perform with furprifing dexterity. It is to be observed, that if the infect is crushed in the palms of the hands no ill effect follows, from which we may conclude, that the quantity of the poison being very fmall, it is absorbed by the callosities of the palm of the hand, and

ed. The Indian carriers who trathere are infects very remarkable for vel through those countries, often crush them between their hands to gratify the curiofity of travellers: but it is not to be doubted that if the coya were to be crushed upon the palm of a delicate hand, in which there were no callofities, or at least none considerable, it would produce the very same effect as when crushed upon any other part of the body.

Those who have occasion to pass through these vallies, if they find themselves bit by any insect in the neck or face, take care not to scratch or touch the place, for the least touch will burst the coya, and it does no hurt unless it be crushed, but defire the Indians who accompany them to fearch where they feel the bite, and if it happens to be a coya, they blow it off with their breath without touching it, and thus free them from danger. Instinct teaches the cattle that feed in thefe vallies to make use of a like precaution, for they always blow very strongly upon the herbs before they eat them; but notwithstanding this the mules sometimes eat a coya, the confequence of which always is a fwelling, and almost immediate death.

VOYAGE FROM ACAPULCO TO MANILLA, BEING PART OF A VOYAGE ROUND THE WORLD, BY PAGES, CAPTAIN IN THE FRENCH NAVY, KNIGHT OF THE ORDER OF ST. LOUIS, AND CORRESPONDENT OF THE ROYAL ACADEMY OF SCIENCES.

(Continued from Page 220.)

PASSED my time in the villages attacked by the Mahometans, whom of Catarman, Lawan, and Palapa, each of which, like all the others in this country, have a little fort, tries on the borders of the sea, forin which is the church. The inhabitants retire to these forts with their ligion; but the Spanish missionaries most valuable effects, when they are

the Spaniards call Moors.

The inhabitants of all these counmerly followed the Mahomedan rehave converted them, and made

them fubject to the crown of Spain; indeed theyexercife almost a defpotic power. They punish them for the finallest fault with whipping; every one without distinction of rank, age, or fex; old men and young women, girls and children, are equally subjected to them. It is very true, that the Jesuits who exercise the parochial duties, have the art fo to govern the minds of those they punish, that they return thanks to the holy father, and voluntarily receive his discipline. These punishments are public, and not difgraceful, as every pedator knows he is liable to the fame, and may to-morrow experience them himfelf.

They are very well informed in religious matters: befides the ufual feast days, they celebrate divine service on two fixed days every week; they fing the pfalms with harmony, devotion, and a natural simplicity, which renders the ceremony very awful. I was there on the day of the celebration of their annual feast: it was conducted decently and with devotion, but according to the Spanish rites.

The custom of dancing in the churches on festival days, has been for some time laid aside in this island, as they very justly thought such a custom dangerous. The Jesuits know by confession, the innermost recesses of the Indian's foul, who comes honeftly to confult them in the least difficulty; the holy father always affifts them with his council, and gives them some small present either in medicines, wine, liquors, or provisions: they alternately use kindness or severity, so that the people easily correct their faults, and look on the priest as a father.

The priest or curate superintends the building of the fort, &c. providing it with cannon; he directs the construction of boats for war, and fometimes takes the command of them. He appoints the commanders, fixes the guard and the posts for the centinels; in short,

poral director. Although I am not naturally an advocate for feverity, or monastic power, yet I could not avoid admiring thefe regulations, and from whatever motive they proceeded, good or bad, they in general tended to the public welfare. This kind of government, as far as relates to the police and the spiritual rule, is the same as the Jesuits observe in their missions at Paraguay; here, however, the Indians find their advantage in it. During my refidence in these islands, advice was received that the king of Spain had suppressed the order of Jesuits in his dominions, and they proceeded to collect the fathers together, in order to fend them into exile. They supported this event with submission and firmnefs, although they had it in their power to effect a revolution, from the fincere respect the Indians entertained for them. The foil of the island of Samar is very fertile, and cultivated with eafe; it yields at least forty for one. They cultivate here no other grain but rice, which ferves for the priefts, the government of Manilla, and the governor of the province, who, as I have before observed, is the only lay Spaniards in a very large extent of country. The Indians feldom use any other food than potatoes, yams, and another root called gaby. also eat many roots while I resided there, their fweet flavour was more agreeable to me then the infiped tafte of rice boiled in water. first they appeared windy and heavy. but I foon became used to them and they nourished me better than rice. I also eat much of the slesh of the hogs, which are fmäller and leaner than ours; the flesh is not heavy, it is dark coloured and streaked like that of an ox. The eggs of the tabon are very common here, and they are fometimes found forty in one hole, the Indians by experience know where to find, and how to get at them. These eggs are heavy, and do not digest well. They distill he is both their spiritual and tem- a good spirit from the bean of the fhrub

thrub called sipe, the fruit of the cocoa tree, and that of a tree called Cabonegro, on account of its black fibres with which they make very good cables and cordage. The Indians also feed on the fruit of cocoa nuts when it begins to grow solid; it then looks like a kind of white glew, but does not digest well.

The Indian of Samar has no other arms or instrument for labour than a kind of cutlass, which he calls cris or campilan. He makes use of it to cut down the largest trees, of which he makes his proa, and fplits bamboo to convert into planks. When any of these instruments have been much used, they serve the women to dig the earth, which is fandy, in order to plant potatoes and other roots. In the space of two months these roots grow very large, and a spot of ground of forty toiles square will furnish more than is fufficient for a pretty numerous family.

They also cultivate sugar canes, cabbages, garlick, onions, melons, china oranges, citrons, pulse, and many other fruits not known in Europe, but these in small quantities. They have bananas in great plenty, twelve or fourteen different species, and of different slavours. They are obliged by government to cultivate cosoa trees, which grow

here to a great height.

The woods are full of cocoas, figs, citrons, bomplemons, (a kind of oranges of five inches diameter at leaft.) pepper, honey and wax. You cannot go any great way without finding bee-hives, they are fufpended to the branches of trees in the form of long gourds.

woods harbour birds of every kind, particularly fowls. They differ from ours by their bodies being thicker and their feet florter; they are of a grey colour fpotted like a partridge. Pigeons also are very plenty; of them they have three species, the first are grey and as large as pullets, the second are smaller, and the third in this linen they make cordage of it. House room is provided in this place with as great ease as cloathing, for the rivers are bordered by bamboos, and the woods are full of the nipe and routan. The latter serves them for nails, with which they secure their bamboos with admirable dexterity, for they do not employ iron in their houses; in sine, two

species are green, and excellent There is also another species of birds called Calao, as large as a goofe, very good to eat, but difficult to catch; they perch on the highest trees, in the neighbourhood of marshy places; they fly very rapid, and are very remarkable about the head, on which grows a large oblong crown, red, smooth, and of the same materials as the bill, of which it forms a part. This ornament, joined to the fize of the bird. gives it a very majestic air, its plumage being black and red. I have had the honour to present the head of one of these birds to the academy. Cocatoos, a kind of white peroquets, and lowries, are here in great plenty, and a great number of pretty little peraquets of different colours, and about the fize of a linnet. There is also a species of small bird, about the fize of a wasp, very beautiful for the brilliancy of its colours, which are fawn, red and blue. The quadrupeds are equally numerous: the woods are full of very large monkeys, wild buffaloes, and wild goats. They gave me many accounts of the various species of serpents, both large and fmall, but I did not fee any that were very extraordinary.

It is equally easy in these islands to provide for cloathing as for food; there is a kind of banana tree, the bark of which is composed of fibres which eafily separate when it is steeped in water; they twist several of them together and make a very fine linen, which is at first harsh, but becomes foft after it is prepared with lime or chalk; they call this thread or fibre abaça; and belides this linen they make cordage of it. House room is provided in this place with as great ease as cloathing, for the rivers are bordered by bamboes, and the woods are full of the nipe and routan. The latter ferves them for nails, with which they fecure their bamboos with admirable dexterity, for they do not employ months

months labour in a year at the utmost are all that is necessary for these people, whose gentle manners sufficiently announce their felicity. The men are of an eafy and open character, and the women gay and gallant without being lewd. The Indians, although little capable to bear fatigue, yet do not fly from it on the least necessity, they are somewhat vain, liars, and interested in their commerce with Europeans, but are neither distrustful or thievish. Their inclination to be friendly has given me an opportunity to remark fuch opennels of heart, as I had not observed any where else, and I think their fenfations are in many respects very delicate.

I was much surprised when I saw the inhabitants precede the kifs, the usual testimony of love between the two fexes, and between parents and children, by a gentle aspiration of the breath of the party they are going to falute. These Bissaye Indians have great tafte for mufic, and are extremely ready in all forts of arts and trades, although they are by no means accomplished masters in any from their little practice. Their muscles are in general more pliant than ours, and they use their feet almost as readily as we do our hands, to take up any thing; they pinch with their toes almost as strongly as we do with our fingers. The fame man will make a mufical instrument out of the campilan he has made use of to cut down a large tree, or to hollow a canoe; the same instrument is also used to draw defigns, and cut them with great tafte on their bamboos, and also to defend them from their enemies; in fine, it is their only instrument for cutting. They make mats of fuch exquifite fineness, that they may be put into the pocket, although they are fix feet long; they are also very expert in various inventions, and paint with very lively colours which they extract from the bark of certain trees.

They manufacture fome pretty

stuffs made of abaca, or the fibres of the banana tree, mixed with filk or cotton; they can also embroider on filk very well, and make lace. When they go to fea they become carpenters, caulkers and failors; on shore they are ropemakers and boat or proa builders. In short, I cannot fufficiently admire their ingenuity, and what is more remarkable, there are not any of them who constantly apply to any one trade, but rather to every one according to their hamours, or their wants. used formerly to write with a style, or kind of pen, on leaves of the cocoa tree, or nipe. They have a custom here which they call massaring, and confifts in giving a circulation to the blood and humours, by making the joints crack, and by pressing or kneading the slesh in different parts of the body. They rub the joints of their children with oil; this customs appear to me very healthy, and is used throughout Instead of cupping instru-Afia. ments they pinch the patient very hard on the top of the shoulder, and this they repeat until they raise blifters; inflead of opening a vein, they cut notches in the flesh. Their pharmacy is better than their furgery, for they are acquainted with many medicinal herbs and balfams.

For cloathing, they wear only a long and large kind of breeches which comes down to the mid-leg, a fhirt reaching down under the breeches to the middle of the thigh, and a handkerchief twirled like a fnake, and wrapped round the head like a turban; when they have a mind to be superbly dressed, they put on a kind of morning gown made of filk and cotton, and they then wear a hat. Long nails are here esteemed a great beauty, but only on the middle and little fingers; I have feen some that were at least two inches in length. The women wear round their waifts a piece of linen or cotton, which being wrapped feveral times round

some of them wear a petticoat made of abaca, which is so fine and transparent, that they are obliged from a regard for modesty, to fold it over before and fasten it at the waist, and this leaves one leg naked: they also wear a shift which reaches only to Their head is coveredthe girdle. with a handkerchief, like the men; but their hair is done up in the form of a coronet on the top of the head; when dreffed they wear a gown. Both fexes having very fine hair, especially the women, who take a particular care of it, they rub it with oil of cocoa, which makes it very thick and black. There are very few homely women among them, although their nofes are fhort and flat at top, but their nostrils are not broad and open like the negroes; their features are fmall and irregular, yet almost all of them have fine eyes and good countenances. Inflead of pitchers they make use of long bamboos fix or feven inches diameter. Sometimes they wear hats made of the leaves of the nipe, like those I had seen before, and when they go to fetch water, the arrangement of their petticoat, their large hats, and the large bamboo they carry with them, gives them altogether an appearance of grace, dig-nity, and apparent pride. The Indians of both fexes who relide at a diftance from the villages, go almost naked, especially those who are far from the mislionaries.

The rivers are full of fish, as are the shores of the island, on which they catch pearls: they take the fish by intoxicating them with a paste made of a kind of bruifed peas, which they call coco; they strew it over the shore at low water, and when the tide is out; the fish when affected by it rife to the top of the water, and are eafily taken. Iron wood, ebony, and dye woods, are here very plenty. Some gold dust קובבכ של לתופה פר בי

Parana pacitam for

the body, covers them to the feet: is brought from the interior parts of the country, but the priests alone are acquainted with this branch of commerce. The Spaniards are prehibited from remaining any time in the Indian villages, under the landable pretence (if that is really the reason) that the manners of these innocent people may not be injured by the corruption of the Europeans. For fome time past the government of Manilla has been endeavouring to restrain the ecclefiastical power here.

I could continue for ever to speak of this country with raptures; it is the most agreeable I have ever feen, and I have often envied the happiness of these Bissayes, for that is a name generally given to all the Indians of the Phillippine Island, who do not inhabit the Island of Luco. The island on which I was, is nia. about feventy leagues round, and has about ten thousand inhabitants; and if I was delighted with the province of the Tegas, Samar gave me infinitely more pleasure. The first presented to my view boundless plains, immense woods, rivers and lakes, the noise of whose waters, and the extent thereof announced the majesty of the Creator. Samar presented beautiful fountains, andrivulets; the whole country is covered with woods, which are not indeed fo majestic as those of the Tegas, but whose trees are some of them covered with fine fruits, or flowers, and others produce excellent bal fams for medicines, (among others the palomaria,) or for perfumes for their houses. The bee-hives fulpended to the branches of the trees, the agreeable adour produced by a white flower, fomething like jeffa-mine, and by a quantity of China roses, all proclaim nature in its infancy, fuch as fhe was elsewhere, before the labour of mankind had changed her agreeable form.

(To be continued.) vilous committees vilous

MADE DURING A TOUR INTO PERSIA IN THE OBSERVATIONS YEAR 1787.

BY M. DE BEAUCHAMP, VICAR GENERAL OF BABYLON,

defire of doing fomething towards rectifying the geography of Persia; and as Mr. De La Lande strongly refled me in his letter to undertake this object, I fet out for that purpose on the 6th of April, 1787. Perfia, on account of its antiquity, and the always been confidered as one of the first empires in the East; and notwithflanding the numberless relations respecting it, which have been given by travellers, the public still eagerly receive any new information that appears. Vot. VII.

for the ancient Persians. Were Persia still what it was in the

time of the Sophis, or even in the time of Nadir Shaw. I should be inclined to think that I could not give better account of it than that of Chardin, the most learned and judicious traveller that ever was in the country. Though there are at present very few remains of those magnificent buildings of which he fpeaks, we have erery reason to believe that in his deferiptions he has not exaggerated with regard to the character of the Persians: smidst the civil dissentions by which Persia is now torn, they are still the same as in the time of Chardin. As the work of this author is now become scarce, I am of opinion that it would be doing a fervice to the public, to give a new edition of it, but less voluminous, and to suppress many reetitions and useless episodes, rectifying at the same time the geographical part, in which Chardin must necessarily have made many mistakes, as he took the longitudes and latitudes from Persian manuscripts. This correction would require an editor acquainted with the Arabic language, in order to rectify those names which have a reference to religion or the

VER fince the year 1781, when feiences. Chardin confesses that he I went to Bagdad, I had a great learned only the Turkish and the

Persian languages.

Having fet out from Bagdad with a Arong caravan, we travelled fix weeks before we arrived at the first mountains by which the defart is bounded on that fide, and which feparate Persia from the territories of magnificence of its sovereigns, has the Grand Signior. I call it a desart, because it is a flat country; but those parts which are watered by the Diala are extremely fertile. As this river. which comes from Persia, and throws itself into the Tigris below Bagdad, has the advantage of being on a level with the land, the inhabitants have made a number of small canals from it, which disperse its water throughout the cultivated fields and gardens belonging to eighty-two villages in its neighbourhood. These villages supply corn, at least in a great part, to the city of Bagdad, which could not fublist by its own produce, though fituated on a large river. Its low fituation renders it almost useless, and the gardens around it cannot be watered but at a great expence, and by means of leathern bags, which are carried by oxen from morning till night.

The first mountains of Persia are exceedingly high, and form a chain which the traveller who vifits that country must cross. We found great difficulty in afcending that which is called Gebel-Tak. The road is remarkably narrow, and passes over a flippery kind of rock, abounding with precipices. The mule which carried my aftronomical inftruments, confifting principally of a clock that vibrated half feconds, a telefcope, and a fmall quadrant, fell down here, and would infallibly have rolled to the bottom, had not one of the drivers who happened to be near, held it by the tail till we could come to its af-

fiftance.

After a march of thirteen days, Nn

we arrived at Kermouncha, a fmall fmall figures in bas relief are ex-Chardin speaks of it in his minth vofume, but in a very brief manner, and and in the other two fix muficians, monument stands at the bottom of a high mountain, from which there limpid water, which falling in cafcades, waters a most beautiful plain. The Persians call this place Tak-Ruftam. This name is famous in brella over his head, and at his fides Persia, and Chardin pretends that it stand a number of musicians. is the fame as Hercules. Others fay that it is Ferhabat, the name of a contains only two figures of the nacelebrated Perfian king. In this place there are two halls cut out in the folid rock in the form of porticoes, one of which is almost double in fize to the other. The largest may be about twenty-five or thirty feet square. At the extremity of this apartment there are four figures; the most consider- days journey of figurea, we croffed able of which is on a level with the It is an equestrian colossal starue, holding in one hand a lance, and in the other a buckler. The whole is in relief; three-fourths raised, fo that it adheres to the rock only by the shoulders of the horse and his rider. The horfeman has on a coat of mail, and his head is covered after the manner of the ancient knights. A little higher there is a kind of cornice, above which there are three other figures in bas relief, but much fmul-That in the middle probably represents fome fovereign who is prefenting a cup, from which water appears to iffue, to the figure on the left, who by his modelt posture seems to be a minister. The figure on the right represents a woman pouring out water. This, in my opinion, alludes to the neighbouring fpring which iffues from this charming fpot. Thele figures may be about eight feet in melancholy country. height, and are of very inferior workmanship. On one side of the hall are the distance of two days journey from out, but withour order, a great Kermouncha, in a place named Same, number of wild boars, purfued by where the Christians pay a toll for hunters, mounted on elephants. These liberty to pass. This toll is trifling

village of Perfia, near which there is tremely well executed. ficu:

The fecond hall, which is smaller, tural fize, placed at the bottom of the portico. By the fide of them are two infcriptions in an unknown language, of which I took copies, in order to transmit them to the Abbe

Barthelemey.

From Kermouncha, till within three very pleafant valleys, abounding with excellent paffurage; but I observed that they exhibited little variety: I met with none of those pictureffue views to common in France and other countries of Europe. One beholds here dry barren mountains; the fummits of rocks indented like embroidery, but not a fingle tree; and plains watered by fireamlets which are fearcely perceptible. This in general is the appearance prefented by the face of the country in Perfia. There is a great deal of exaggeration in the accounts of old travellers, and it may be readily perceived that even Char-din was a little prejudiced in favor of the beauty and climate of Perfia This matter, however, may be determined in a few words, and by a fact which cannot be conteffed b modern travellers: every country del titute of wood and water is a very

I was exposed to fome trouble at

when Perfia is governed by a fovereign; but at present, when every proprietor of a village is a despor, it becomes very arbitrary. I had a great deal of difficulty with the Kan of this village, who made me open my portmanteau; took from me a box containing my papers, together with my money, and would have broke it open had I not been supported in the re-Affance I made by a Turk of Bagdad, whom I knew; who came to my affiftance, and who took it from him, loading him at the fame time with every reproachful epithet that a Sunni, or orthodox Muffulman, can bestow upon a Chia, or a protestant Mus-fulman. I must here observe, that Christians are molested much more in Persia when they travel than in Turkey. Every time-they enter a new province, they meet with difagreeable treatment, on account of this arbitrary tax to which the governors' fecretaries subject them. the states of the Grand Signior, Christians may travel in perfect freedom. When they have paid the tribute of me current year a receipt is given them, and by producing this paffport ey may go wherever they choose. Europeans, in virtue of their stipulations with the Porte, pay nothing. It is fufficient if they only thew from what quarter of the world they come. From Kermouncha to Hamadan we passed a great number of cities in ru-The latter flands at the bottom of a chain of mountains called Alonend, which Chardin fays, are a branch of mount Caucalus.

I was aftonished to see these mountains covered with snow in the end of May, under the latitude of thirty-four degrees, especially as they did not appear to me nearly so high as those of Auvergne. I have seen fnow upon mountains of much less height in the month of sune, and about the latitude of thirty-fix degrees; which makes me presume that Persia is an elevated country. Is spahan, though shuated in a valley, retains for three

months the fnow, which falls there in great abundance.

Between Hamadan and Ifpahan we found the foil through which we parfed exceedingly good, but almost uncultivated. There is none of it tilled, but Imall fpots in the neighbourhood of the villages, which are very few in number. Chardin fays that no more than the twelfth part of Perfia is inhabited. The case however, at present, is much worse; for I can safely affirm that in all the northern part which I traversed, not above the thirtieth part is inhabited. The province of Hamadan, which is in Irac-Agemi, appeared to me to be better cultivated than any of the rest.

In going through the defiles of the mountains we were alarmed by the appearance of some horsemen. had been perceived in the evening, and the director of the caravan was of opinion that we should depart immediately; but those most interested absolutely refused, telling him that it was extremely dangerous to pass the mountains in the night time. difficult matters, the Perfians have recourfe to divination, which is done by feveral different methods; but they generally apply to some Mullab, who opens the coran as chance directs, and reads the first verse he casts his eye upon, which he adapts to the present conjuncture.

The mountains which we croffed. form as it were the roots of Mount Alouend. The stone of which they are composed is of a blackish color and exfoliates like flate. A kind of thiftle with a long ftem is found here, which is used as food by the natives of the country. I are some of it, and found that it had a fourish tafte, something near to that of celery. On the 27th of May we encamped in a charming valley, furrounded by mountains fo low, that I took up only a quarter of an hour in afcending to the top of them. Here the cold was fo intente and piercing at the time of fun riting, that the children of our caravan could not help crying. The water in our drinking vessels, which were of leather, was frozen, and this at a seafon when it was so warm at Bagdad, that the people had for some time sleept on their terraces. I was still more aftonished when at Cashbin, to see snow there on the 8th of July.

Chardin fays * that the highest mountains in the universe are found in Persia. Mount Taurus, adds he, which traverses the whole kingdom, has fome pointed fummits; the extremities of which, on account of their great height, are never feen. This affertion of Chardin, I am of opinion, is rather ill founded. I can hardly allow my felf to believe that there are mountains in Persia so high as those of Chimboraco in Peru. I know that there are some very high in Armenia, and on the fouthern and western shores of the Caspian sea. in the country of the Agvans. But I am much furprifed to fee Chardin affert, that " the highest " parts of these mountains are mount " Ararat, in upper Armenia; the " chain which separates Media from " Hyrcania; that which is between " Hyrcania and the country of the " Parthians, and particularly mount " Amavend+; the mountains which " feparate Chaldea from Arabia, and " that which is between Persia and " Caramania." I croffed part of these mountains, but I did not find them remarkably high, though they were then covered with fnow. From this I should only conclude that the situation of Persia is very elevated. Chardin has remarked, that properly fpeaking, this kingdom is not watered by any river or rivulet, which is very true. This reflection Hill tends to Support my opinion. If it be high it receives no rivers, and it produces none on account of its naked barren mountains, which are composed only of rock.

Hpahan, that famous city of Afia, is feparated from agreeable and folitary valleys, by a defart which we traverfed in three days, I observed a tree here, which may be called the dwarf prickly almond tree. Its leaves are small, and sharp pointed; its branches are covered with prickles, and the fruit, which is smaller than our almond, had exactly the same taste and shape. I was told that abundance of these trees is to be met with in Persia. These mountains produce a great many curious plants. Among those which struck me most, there is one that may be justly called the vegetable hedge hog. This plant forms a lump of almost a foot and a half in diameter. It is a little convex, of a beautiful green color, and full of hard sharp prickles, which render it impenetrable.

Here we found only a few small streams of water, which afforded fome relief to our camels, The foil of this country is stony, and produces nothing but some prickly shrubs, scat-tered here and there. In these wild and difmal regions the ear is never delighted by the voice of any of the feathered tribe; and the maiestic filence of nature which I had so often observed in the desart every where prevails. Having lain down here to enjoy a little repose, I heard a humming noise like that made by a fpinning wheel. I immediately got up, and following the found, arrived at a prickly shrub, upon which I perceived an infect of the aptera kind, of the length and thickness of the thumb, of a black color on the back, and yellow under the belly; but I afterwards faw fome of the fame species, which on their backs had two yellow bands, a little spotted. In body is composed of seven or eight circular belts laid one over the other, which ferve it as a coat of mail; its head, which is of a pale yellow color, is large, and almost square; and it has two round lively eyes, half a line in diameter. Its face above the eyes is marked with fmall black fpecks: it has two antennæ about an inch in length, and four fmall trunks, It is provided

* Tom. IV. p. 10. + I think he here meant to fay Alouend. withfix claws of a yellowish greycolor, and spotted like the space above the eyes. On its back there is a kind of hood, three fourths of an inch in length, which adheres to the head, and which has no inconsiderable refemblance to those worn by the nuns. It covers part of its back and sides, and forms only one piece. When it hums it raises this hood, and discovers below two small round bodies like cymbals; one of which covers the other a little. These two bodies sife up and move with great rapidity. This insect does not leap, and finds

great difficulty to escape. In this folitary fpot I gave myself up to reflection. Behold then, faid I, the environs of that famous city, the mme of which refounded throughout the whole universe. The defart spots wound it, contrasted with its delightful gardens, render the first view of i full more furprifing. No grand highway, no avenue, no river leads in it, for I do not reckon the Zenderwhich has but a fhort course: and had I not known that Ispahan was the distance of a day's journey, I ould never have imagined that I was sear a city, which in the last century vu immense, Ispahan is like the Listian fields, the approach to which, mether with the gloomy water of the niver Styx, exhibited fomething tertible. This reflection called forth nother which I had made long before. How came it to pass that some of the most famous cities of the East existed in defarts? I do not speak nerely of Ispahan, which is rather a nedern than an ancient city, and thich is perhaps indebted for all its mandeur and celebrity to the river Lenderoud, that waters its environs. It is natural to suppose that this atuation has been preferred on account of the great scarcity of rivers in Persia; but the famous Babylon, the built on a river much renowned, food in a defare, unless we suppose, alam inclined to think, that the bed of the Tigris, and that of the Eubey are at present, were united in

withfix claws of a yellowish greycolor, many places by a great number of and spotted like the space above the canals, which rendered the land much great. On its back there is a kind of fitter for cultivation.

Hella, on the Euphrates, still supplies provisions, it is true, to a great part of Bagdad; but what is the modern Bagdad in comparison of the ancient Babylon? If we reflect then on the grandeur and magnificence of Bagdad, under the Caliphs, how can we believe that these sovereign pontiffs should have neglected Tekrit or Samara, in Mesopotamia, in a climate rendered temperate by its mountains: that they should have come hither to found this city, celebrated in their time, and transferred the feat of their vast and powerful empire to a burning defart scorched by the rays of the fun? The fituation of Palmyra is still more furprising: at the distance of three days journey from Damascus, one is aftonished to see the splendor of granite and marble, in a place destitute of water, except what was conveyed to it by aqueducts. The city of Ispahan cannot be feen at a great distance, because it is hid by the trees of the numerous gardens which furround it. The first time I passed through it I had not leisure to examine it with proper attention. Being in a great haste to get to the borders of the Caspian sea, I took advantage of the first caravan that set out for Cashbin. In the course of this journey, I observed that there is a great difference between the state of Persia at present, and what it was an hundred years ago. Chardin, in his third volume, besides the pompous descriptions of Cashbin, Koum, and Cashan, which he has given, relates, that on the same route which I purfued, he traversed charming and fertile plains, covered with villages, upon which I faw nothing but deferted cities, the melancholy remains of habitations, and lands for the most part uncultivated. Though Chardin, it is true, reports what he faw in a very natural manner, and gives an air of truth to every thing he fays, it is easy to perceive, in the course of his work, that he is a little too much prejudiced

times even he exaggerates respecting the goodness and ferenity of the air, to which he ascribes wonderful effects, fuch as the great light produced by the flars in the night; the vivacity of dies and colours, the whiteness of linen, and a thousand other properties of the like kind. That I may not have occasion to recur again to the fame object, I shall here remark, that it was from a want of observation that Chardin pretends, that the stars do not twinkle in Persia. The sky in Chaldea is fully as ferene, yet, by being accustomed to sleep on a terrace, I had an opportunity of perceiving, that the flars twinkle there even till about the height of forty-five degrees, and that from thence to the zenith their twinkling is not fensible. This twinkling is much stronger in winter and spring than in summer: I do not think, therefore, that the sky in Chaldea is much finer than that of France. Since my return to Paris, I observed the stars on the observatory of the Military Academy, and I made Mr. de la Lande observe, that the Lyre and the Eagle, which were upon the meridian, did not twinkle, and that the twinkling of other stars did not tile above forty or forty-five degrees. I might, I imagine, have described the climate of Persia before I went thither, by judging that it could not be drier than that which I inhabited ; but I ought to be circumspect in censuring a man who resided long in the country, and whose description entitles him to confidence. Chardin feems also to have exaggerated a little, when he fays, that the stars alone give sufficient light for people to travel, and to know each other." During the journeys which I made in the light time, I never observed that effect. People know each other, it is true, at a hear distance, but perhaps, rather by their drefs, their gait, and the manner in which they are mounted, or any thing elfe, than by their

his work, that he is witten common

best string

prejudiced in favor of Persia. Some- figure. This, however, is nothing extraordinary, fince the case is th fame in Europe. With regard to the great beauty of the sky in Persia, I am not of the same opinion with Chardin, when he expresses himself thus: "The beauty of the sky in " Perfia, I can neither forget nor pafs " over in filence; one would almost " fay, that the heavens there are more " elevated, and of a different color. "from what they are in our foggy climates of Europe." This appears to me a little too general. If he means to fpeak of the northern part of our climates, he is in the right, for he might then compare with it the ferenity of the air in Spain and Italy, which are much nearer us; but, for my part, I found the beautiful nights at Paris equally delightful as those at Bagdad or Ispahan. The incontestible advantage which their climates has over ours, is that continuance of fine weather, that pure air which one breathes on the terraces, and that beautiful aspect of the heavens, known in Europe to philofophers and aftronomers only. In the East every body enjoys it, and travellers who admire it must pay attention to those accessary circumstances, which, without their perceiving it, excite the most pleasing fensations.

The first city on the road from Ifpahan to Cashbin is Kachan, where I experienced a very great heat on the 16th of June. The water here is difagreeable, and the air appeared to me to be unwholesome, if we may be allowed to judge from the pale, livid complexions of the inhabitants. This city is not what it was in the time of Chardin, though it is still a place of The bazars, o confiderable note. markets, are beautiful, and extremely long. In this place I think there is more and better kitchen utenfils manufactured, than in any other part of Persia. I went through one bazar, which was very long, well covered, lighted from above, and containing

cater folidity. The road from Ifhan to Kachan employs four days, ad proceeds due north.

From Kachan I travelled to Koum, ping twenty degrees to the West. This city no longer corresponds with description given of it by Charan, except in its famous mosques or

smoll nothing but braziers shops. In tombs, which are, however, kept Torkey and Persia it is enflowary to in very bad repair. On quitting this sanufacture all metals, and even difmal fpot, I croffed the valley of offe-shoes, by cold trammering. This marine falt mentioned by Chardin, or is redious and fatiguing, but the the falt of which is in feveral places Brent articles acquire a much an inch in thickness, and well christalized. From this valley you behold mount Telefin, or the Enchanted, which is remarkable for nothing but the childish tales told of it by the Perfians: a small river flows in the neighbourhood, the water of which is extremely heavy and brackish.

[To be concluded in our next.]

DESCRIPTION OF CARLSCRONA WND RUNNEBY, IN SWEDEN:

BY A DUTCH OFFICER.

the province of Blekingen, and the relidence of the governor, is fituand on the shore of the Baltic, and ation a large rock, which forms an md. Charles XI. by whom it was funded, honoured it with his name, and gave it the privilege of being a town. To arrive at it, one and pass two other islands, which are ed to the continent by large idges. On these two islands there two fuburbs, which are pretty enentive, but as they are inhabited mly by the lower classes of people, This, are ill-built and dirty. mever, is not the case with the own itself, which is well built, the greater part of the houses of wood. Several of them confift three stories, ornamented with diprure and colonades, and fo nearly ed, that they exhibit a very adfome appearance. Great pains beltowed upon the embellishment wrender it in time one of the pretlift towns in Sweden. A church, wilt at one of its extremities, to-

VARLSCRONA, the capital of fquare, in the centre of which it is erected. This fquare is very extenfive, and, according to the plan laid down, will be bordered by feveral beautiful edifices. Whilft I was at Carlferona, workmen were still employed in levelling it, and during my residence there, I every day heard explosions, occasioned by their blowing up the rocks, which rendered it rugged and uneven. The fame operation was performed in different ftreets, where the rock rofe in many places into points disagreeable to the fight, which were inconvenient for foot travellers, and prevented the use of carriages. Few of the ftreets are paved, and as you trend upon the bare rock, walking here is extremely fariguing. The inhabitants of Carlferona pretend that Blekingen is the most beautiful province in the whole kingdom. I am not, however, entirely of the fame opinion; for towards Smoland it appears to be very this place, and no expence is spared mountainous, but towards Scandia the country becomes level, exhibits every mark of fertility, and is covered with beautiful trees, and among ands the dock-yard, will contribute others the oak. I faw also feveral men to ornament it, as well as the flourishing chares belonging to dif-

From this mountain we have borrowed the Persian word Taltfman.

^{*} A town or city which has a public magazine or repository for goods.

ferent proprietors, ornamented with mansions, which at a distance seemed had also been in the Dutch service, and have a magnificent aspect. This but it is obliged to furnish a regiment of marines. The marine militia, difperfed throughout different parts of Dutch. Sweden, amount to about 13,000 men, of whom no more than a thoufand are employed in the time of peace, or when they are not exercifed. The garrison of Carlfcrons consists of about sixteen hundred men, divided into three companies. As I was furnished with two letters of recommendation, one to Mr. Pylgardt, a rich merchant, who was honoured with the title of patron of the mines; and the other to Rear-Admiral Chapman, director of the dock-yard, I was received by both these gentlemen in the politest manner. Having fignified to the latter, that I had come to Carlfcrona partly with a view to fee the works at the dock-yard, and the new dock, which I had heard so much celebrated, he promifed to procure me admission to them next morning, and in the mean time permitted me to examine the plans of them drawn by himself. Rear Admiral Chapman is a gentleman as much valued for his perfonal qualities as for his abilities, which raised him to his present station. He is much respected, and the Swedes entertain a high opinion of him, and particularly with regard to his skill in constructing ships. He has invented a new form for the hulls, and it is afferted, that all vessels built after his model, are infinitely better failers than others. He has written a treatife on naval affairs, which is held in great estimation.

Next day he was fo obliging as to fend an officer to me, who had ferved in Holland under Mr. Dedel, and of notice. The most perfect order who bestowed the highest praises on seems to prevail here. After this we his old captain, whose character and went to see the new dock, of which chilities he greatly extolled. They conducted me to the port. which is capacious, very commodious, and furrounded by docks. Veffels out of commission are moored here close to a long bridge, which affords one the pleasure of walking across the whole fleet. I counted here twenty veffels, comprehending thips of the line and frigates, among which I faw one of 100 guns, one of 96, one of 84, two of 74, and feveral of from 50 to 60. I faw nine vessels which had been constructed in the course of four years. Five of these nine were entirely finished, and fitting out; the other four were launched, but not rigged. There were feveral others on the flocks, either begun or having their infide timbers put together. One in particular was pointed out to me, all the parts of which having been prepared before hand, was constructed in the space of fix weeks. The plan for renewing the Swedish navy was formed four years ago; part of 1782 was employed in procuring and preparing the materials, and in 1783 vessels began to be built. It is intended to continue construct four ships annually, until the navy shall be put on a respectable sooting. To defray the expence incurred by the execution of this plan, the king has suspended the half of the works at the new dock, until the navy shall be in that flate which is defired. I faw every thing relating to the docks, and my conductor was fo polite as to point out to me what was principally worthy

One of these ladges, with its canal and fluice, is entirely finished. The bottom of it is cut out in the rock, and the fides are built of cut stone, joined together with Pozzolane, which is a kind of cement, brought from Italy at a very great expense. The bottom of it is shaped like the keel of a vessel. Along each side of the lodge there are two rows of fteps, which serve for supporting beams and in lodges. feaffolding when the veffel is dry, and has need of being repaired. The walls which support the roof are of cut stone, joined with the same kind of cement as before. These walls, which are at least twenty feet in thickness to the top, where they must be on a level with the upper deck of the vessel, separate the different lodges. with the interior part of the lodge, favings gained by keeping velfels in by means of large arched windows, this manner. These platforms are intended to receive the guns of each veffel, which may be conveyed in or taken out through these windows, constructed in fuch a manner as to be opened or Vol. VII.

This is a work worthy of the ancient turn. When the canal and lodge have received the requifite quantity of water, the vessel enters; and when it may be necessary to leave it dry, a communication at the bottom of the lodge is opened by a machine made expressly for that purpose, and the water runs into a bason much lower than the lodge, and cut out also in the rock, from which it is conveyed into the bason beforementioned by means of a windmill. Whilft I was here, workmen were employed in configurating a fecond lodge. The first may serve as a specimen of the magnificence of the whole work. When finished, these lodges will form a vast semicircle. but, according to every appearance, they will never be brought to perfection. The immense sums which government is obliged to expend, will perhaps induce them, instead of finishing this, to complete rather the old dock, which will be of as much utility as the new, though ships cannot be laid up there under cover, and

It is very doubtful, whether veffels preferved in this manner last longer than others. Even supposing that thips theltered from the inclemencies of the weather, are less subject to rot than those which remain in the open air, it is to be enquired, whether the millions expended in constructing these lodges, sluices, basons, canals, At that height they are converted &c. and the repairs, which all thefe into platforms, which communicate require, can be compensated by the

The person who suggested the first idea of this new dock, which was begun in the reign of the late king, is a very old man, of the name of Thunberg. He has a fon, who is that according to circumstances. The reckoned to be equally expert as his soof is of wood, covered on the out- father. This Thunberg has the difide with large plates of iron, and rection of the works and fluices, formed to as to ferve as a fulcrum to which have been conftructed along different levers, employed in loading the Gotha. The old dock was begun or unloading the vessel. The fluice in 1715, after the plan of Polheim of communication is made with fo the engineer, and finished in 1724. much art, that the small force of two It is a kind of canal, 350 feet in teet of water raises it, and makes it length, and nearly 30 in depth, dag

These canals are shut by large sluices. Before that which opens a communication to the fea, there is a piece of machinery, very ingeniously conftructed, which defends it from the efforts of a high tide. When a ship is brought in here, and when it is necessary to leave her dry, in order to be hove down, the fluices are fhut, and by means of att immenfe pump, put in motion by feveral men or fome horses, the dock is rendered perfectly dry in the space of twelve The dykes, fluices, canals, and mills, which the Dutch industry has executed, are juftly admired, yet, when we confider that all this is cut out of the folid rock, we are obliged to confess, that our works are nothing in comparison of these, which, perhaps, are not equalled by any in Europe.

The entrance of the port of Carlscrona is easy on account of its great depth, and it is so large as to be capable of containing an hundred ships of the line. It is defended by two very ftrong forts, well mounted with artillery, which are fo planted, that when fired, their shot cross each These forts, the one called other. The failors belonging to the gar. rison of Carlscrona are employed in different works in the dock-yard, when they are not obliged to be on board their veffels. The greater part of the officers are men of great ex-perience, and must naturally be so, since, if they wish for promotion, or to be held in any estimation, they must travel, and serve for some time in foreign countries, and particularly in those states, which are carrying on war. This, doubtless, is an excellent regulation, and must tend great. ly to procure good naval officers to Sweden, I quitted Carlicrona, de lighted with the town, and its inh. bitants, as well as with all the works. which I greatly admired.

Three miles thence I stopped #1 large village called Runneby, fituated in Blekingen, half way between Calscrona and Carlsham, which is celebrated for its market, and which appeared to me to be in a very flourising condition. At the distance of half a league from this place, the little river of Aune forms a very fingular cataract through rocks, which exhibit nothing but devastation and ruin. The water precipitates itself between two enormous fragments of rock, which appear to have once formed only one mass, and which at present are at the distance of twenty or thiny feet from each other. They fland exactly parallel, and feem to be so or 50 feet in height. The one is a convex in the interior part as the other is concave, and a third of les fize lies upon the top of them, which forms a most fingular bridge. The road passes over it, and appears tru awful, on account of its fituation, and the horrible noise occasioned by the efforts of the river, which throw

itelf with great violence through the me an opportunity of clinging to the point of a rock, I should have tumbled down the precipice, and been flelves of rock, around which the either drowned, or dashed to pieces water in some places is upwards of on the rocks by the force of the cur-forty seet in depth. Here I was in rent. This place, so remarkable for the different parts of the rock, which are concave on the one fide, and ty and danger, and jumping from one convex on the other, evidently anfione to another, in order to find a nounces that an earthquake or some other convulsion must have occaketch of this picturesque scene, I had sioned here the most dreadful ravage. This river, which is not large, throws

LETTER FROM ABBE TESTA TO M. DE LA LANDE, ON THE STATE OF NATURAL PHILOSOPHY at ROME, FOR THE TWO LAST CENTURIES, AND ON THE CONDEMNATION OF GALILEO.

HAVE the honour to fend you, Sir, a Memoir just published by Abbe Calandrelli, Professor of Mathematics in the Roman College, on the subject of a paratonnerre, or electrical conductor, which he has placed by order of the Pope, on the Quiriaal palace at Rome. On perufing it, you will readily perceive, that the learned and industrious professor is unacquainted with nothing that relates to the theory of electricity, or the precaution to be taken in confructing fimilar machines for guard-ing edifices from the effects of lightning. I doubt not your being fatis-

April 20, 1790. fo deeply wounds the honour of my country. I shall produce well-known and incontestible facts, which will no doubt be sufficient to undeceive many. Your love of aftronomy, and the particular zeal for the glory of the great Galileo, which you displayed when at Rome, affure me that you will not be indifferent to some ecclaircissement

of a part of his history.

The first Academy that proposed the revival and improvement of phyfics and natural history, renouncing with a noble boldness, the reveries of the schools, and employing only obfervation and experience in the fludy hed with it, and that your suffrage of nature, was the Academy of the will afford me a fresh argument Lincei, sounded at Rome by Frederic against those who believe, and en- Cesi, in 1603. Martin Fogel, a learndeavour to persuade others, that the ed German, had collected some mescience of natural philosophy is alto- moirs of the history of this Academy, ether neglected and profcribed at but he died before he had finished his What we are most strongly work. Leibnitz purchased his manureproached with, though it is now script, and afterwards deposited it in of ancient date (1633), is the con- the library of the Princes of Wolfendemnation of Galileo, the circum- buttle, where it now is. Jean Bianflances of which are exagglerated, and chi, or Janus Plancus, a skilful natuits injustice aggravated. I know not talist of Rimini, known by his discohow often, fince I have dwelt in Pa- very of the cornua Ammonis in the ris, I have heard this event cited as a Adriatic sea, procured a copy of this demonstration of the ignorance of the MS. enriched it with his own enquicourt of Rome, and its hatred to ries, and published it under the title learning. Permit me, Sir, to take of Notitia Linceorum, before the 2d this opportunity of entering into some edition of the Phytobalanon of Fabius particulars relative to a subject that Colonna, printed at Florence in 1744.

For a just idea of what natural philofophy owes to this Academy, I must refer to that memoir; contenting myfelf here with enumerating the names and works of a few of its most distinguished members. F. Cesi, its founder, was author of the learned tracts, entitled, De Calo, de Metallophytis, de Prodigiis, Apiarium, & Tabu-le Phytosophice. He broke with a bold hand the solid spheres with which the Ptolomean system had loaded the heavens. He first employed the microscope to observe the feeds of plants, whillt Francis Stelluti, his affociate, was the first to examine infects with the same instrument. He first gave the names of telescope and microscope to those infruments which still bear them, and which he learnt to construct with his own hands. He employed himself, in concert with his Academicians, in publishing and enriching the grand work of Ant. He-nandes on the Natural History of Mexico. Death prevented him from committing to the press a work, still existing in MS. entitled, Theatrum Nature. John Baptift Porta was also a Linceo, and all the world knows how much natural philosophy and optics are indebted to that philofopher. He was the first who employed himself on condensing air, and was the inventor of the air-gun, which in a few years became common throughout Italy. John Fabri was the first to combat the generally adopted opinion of the production of animals by putrefaction, in which he was followed by Redi and Malpighi, who gave it the final blow. Thus Fabia Colonna preceded Tournefort, who confessed that his fystem of plants had been already invented and proposed by this Lingeo, and by And. Cefalpani. Fabius gave the name of petala, to the leaves of flowers, which they have still retained; and first demonstrated, that mountains far distant from the sea,

coveries have given celebrity to the Academy of the Lincel would be too tedious; fuffice it, that the great Ga. lileo was to proud of his affociation with it, that the fole title he boalts at the head of all his works, is that of Linces. Having grown blind in his old age, he frequently stiled himself in joke, una lince creea. The discourse on comets of Mario Guiducci, fecre. tary to the fame academy, was the origin of the disputes which after. wards arose between Galileo and his enemies, whose harred was not anpeafed but by the condemnation of that great aftronomer. The hiftory of the Lineei, being fo connected with that of Galileo, I know not how the celebrated historian of astronomy, Mr. Bailly, speaking of the foundation of modern academies, forgot this, which preceded them all, and which by in example taught philosophers the true means of cultivating the fludy of nature. The academy could not bet have derived new luftre from the pen of fo profound and eloquent a writer.

The Cardinal Francis Barberini fucceeded F. Cefi in the Prefidentihip of the academy; but at the death of its founder, who, by his knowledge and example, was, as it were, its foul; the zeal and industry of its members flackened. This gave Mr. Ciampini the idea of establishing another academy; which he did under the name of Phylico-Mathematical, in 1667, at the inftance of Cardinal Michael Angelo Ricci, one of the best geometricians of his time. It was executed under the auspices of Queen Christina, who was then at Rome, making Italian verses with Abbe Guidi, famous poet, ardently cultivating natural philosophy, and palling whole nights in observing the heavens with Cassini, of whose health she was so careful, as frequently to cover his head with a handkerchief, to defend fossil bones, and shells, found on it from the air; a circumstance with which that aftronomer was fenfibly are the remains of real animals, and affected, as related by himself in a not the sport of nature, as they at that manuscript account of his life, now in time supposed. But to name all the the possession of Count Cassini. The illustrious men whose labours and dis- new Roman academy acquired great

reputation

reputation from its commencement, those of Paris and London were efirous of its correspondence. Mr. Ciampini was an indefarigable man, s appears from the numerous lift of his works, of which I shall only menfion his effays on earthquakes, on the Amianthus, and on a new manner of confirmating optic tables, invented by him, and his observations on the conet of 168r, ever celebrated for the calculations of Newton, and the phiphical reveries to which it afterrands gave birth. Ciampini had for fociates Alphonfo Borelli, Francis Montanari, and Paul Boccone; alone fufficient to give luftre to my academy. How far the two forper excelled in geometry and aftronomy is well known, but few are requainted with the extent of their kill in natural history.—Borelli has given as the meteorology of Mount Ema, and a history of its eruptions, in which respect he was the precursor of M. le Commandeur de Dolomien, who has lately described the volcanic onducts of that mountain as an able Bianchini made fome eseuralift. learned enquiries concerning the Lake of Albano, the fpring-waters of Rome, and the fires of Pietramals, which Mr. Spallanzani and the Chevalier Volta have lately discovered to be occafioned by inflaminable air, formed and foontaneously accended in that place. At that time a tafte for natural history was most prevalent with us. Of this the Roman Ephemerides are a suffi-Many cabinets of nacient proof. tural history were also formed, the most excellent of which was that of Father Kircher, which still exists, and has lately been augmented by Cardinal Zelada, a man unacquainted with no branch of science or literature.

Such was the ardour, Sir, with which physics were cultivated amongst us, whilst the unfortunate Swammerdam could not find a fingle person in all France to purchate his infects and anatomical preparations. Before I quit this article I ought to observe, that a taste for cabinets of natural his-

time of the academy of the Lincei. The Metallotheca Vaticana of Mich. Mercan sufficiently proves this. He was employed by Sextus V. to form a collection, of which he wrote an account, that was not published till 1717. Mr. Lancisi was the editor, and notes on it were written by Mr. Affalti, Professor of Chemistry. ir the figures of chrystals, and artificial chrystals of alum are spoken of; and it is surprising, that Mr. Rome de l'Isle has not mentioned it in his Chrystal-

lography.

Whilft the academy of Mr. Ciampini was to fucceisfully employed in the promotion of natural philosophy. and enjoyed a well-deferved reputation, it had at Florence a rival fur-passing it in celebrity;—I speak of the academy Del Cimento, founded in 1657 by Leopold de Medicis. For the honour of Rome, however, its first successes were owing to the exertions of Michael Angelo Ricci, a Roman. This Ricci was fo skilled in physics, that Borelli would admit no other arbitrator of a difpute which he had with Steph.de Angelis and Michael Manfredi, on the subject of his work De Vi Percussionis. The merit and reputation of Ricci determined Innocent XI. to give him a Cardinal's hat, notwithstanding his modesty led him This homage to refuse that honour. paid to science in the person of Ricci, little accords with the calumnious falshood broached by the enemies of the court of Rome, that Clement IX. would not grant the Cardinalship to Leopold de Medicis, buyon condition of his suppressing the academy Cimento. Mr. Fabroni, director of the University of Pisa, well known by his Vitia Illustrium Italorum, credited this account; but he has fince retracted, and furnished authentic proofs of its imposture. How could any one thus flander the memory of a pontiff who studied philosophy under Castelli, who protected Galileo to the utmost of his power, who did not part with Caffini to Louis XIV. but with extreme regret, who faved Father Riccioli from tory prevailed at Rome long before the the tricks of an Inquilitor, and finally,

who had formed the project of esta- the just title of the Lucretius of the blishing at Rome that very academy Newtonian Philosophy. To return afterwards founded by Ciampini.

Whilst natural history and physics were cultivated at Rome with such fuccess, astronomy and mathematics were taught there by men of the first rank in learning. The works of Lurank in learning. cas Valerius, on the centre of gravity, and quadrature of the parabola, prove, from that time vowed his destruction. that he was not unworthy the title of Mathematicus sublimis, conferred on him by Galileo. The doctrine of the centre of gravity was carried to its highest perfection by the famous Guldini. Castelli, the friend of Galileo, may be confidered as the father of Hydraulics. Toricelli, Borelli, and Ricci, were his disciples, the former of whom succeeded him in the Mathematical chair.

Since the reform of the calendar. which will render the name of Gregory XIII. immortal, Rome has ever possessed Astronomers of celebrity. Hence France received the father of its astronomy, Cassini. There is the noblest meridian in the world, traced by Bianchini, and rendered famous by his observations. There was written the first commentary ever published ship. He went thither a second time on Newton's Principia, whilft his divine fystem was so strongly combated in France by the zealous defenders of enemies. With these he entered in the Vortices of Descartes. After the disputes on the nature of comets, the famous expedition of the French Aca- spots in the fun, &c. omitting nothing demicians to the Pole and Equator, the to confound them and turn them into Pope's territories were the first in Europe in which a degree of the Meridian has been meafured. Whilst Fathers Boscovich and Maire were employed on this at Rome, the Commentators of Newton were determining the length of the pendulum there. Father Beccaria, who afterwards meafured a degree in Piedmont, explained and improved the theory of electricity; and Donati, to whom we are indebted for a beautiful history of the Adriatic, travelled, by the Pope's orders, to collect observations on natural Cardinals Orfini and Monti, who history, in the kingdoms of Naples avowed themselveshis protectors. Le and Sicily. Benedict Stay still lives, us observe, that the preceding year and enjoys the fame he has acquired this very fystem had been acknow. by that poem which has procured him ledged to contain nothing contrary in

to Galileo, the true theory of comets was known at Rome even in his time: this his disputes on their nature and origin sufficiently prove. He was in an error; but by the superiority of his genius, he overpowered and covered with ridicule his adversaries, who

Genius and great talents have ever found enemies; but fince the condem. nation of Galileo has been particularly cited as the height of ignorance and superstition, permit me to relate a few particulars, which will shew the slig foundation of those reproaches. Gr. lileo went thrice to Rome; -the first time in 1611, to consult the philosophers of that capital concerning his discoveries, and to hear their opinions of them. There he foon acquired the friendship of Cardinal Monti, of the Jesuit Clavius, who had so great a part in the correction of the Calendar, and particularly of Fred. Ceff, who was eager to receive him into his Academy. During his first above at Rome, he received every token of the highest esteem and sincerest friendin 1615. The fuperiority of his talents had already begun to make him ridicule. His Saggiatore, of which Father Grassi was the object, is a chef d'œuvre of elegance and address. Never were the dangerous weapons of irony and farcasm handled with more dexterity. The laugh was encited against his enemies, but their jealoufy was converted into an implacable hatred, and they thought of nothing but vengeance. The very next year they procured an order in him no longer to teach the motion of the earth, in spite of the efforts of

the faith. He then departed for Florence, being recalled by the Grand Duke, his fovereign; and in 1632 he published his celebrated dialogues on the Mundane System, in which he collected all the force of reasoning, and bitterness of wit, to complete the overthrow of his enemies. Disobedience was immediately their cry. It was infinuated to Pope Urban VIII. who had hitherto been a great patron of Galileo, and had even made verses in his praise, that he was meant by the person of Simplicius, characterised as in ignorant and prefumptuous scholaftic, in the dialogues above mentioned. This succeeded; and in 1633 Galileo was obliged to return to Rome to give an account of his doctrine. There he refided at the house of the Grand Duke's Ambassador. His friends, amongst whom was the Mafter of the Sacred Palace, prepared for his defence; but the Aftronomer destroyed the effects of their good offices, by his railleries and fatires against his adversaries. In vain did the Ambassador urgently intreat him to be filent. The minds of feveral were irritated ;-his enemies conquered, and on the second of April he was obliged to remove to the house of the Inquifition. But let me request you to attend to the following particulars :- The Fiscal of the inquifition gave up to him his own apartment; the Tufcan Minister supplied his table; and he had the liberty of walking about the inner-court of the palace, of writing to his friends, and of receiving their vifits. At the end of the month he made his recantation; after which he left the Inquisition, and went again to refide at the house of the Ambassador. This is a faithful account of the imprisonment, cruelties, and barbarities, exercised against Galileo by the Inquisition of Rome. That aftronomer owed the treatment he received, and which, as has been Icen, was very different from what has been fo unfoundedly supposed, only to the obstinate hatred of his enemies, and the imprudent rashness of his own conduct, As to his doc- more than ever at Rome, Bologna,

trine, it had been declared orthodox the year before, as we have already observed. The Copernican System had been taught publickly at Rome with success by Copernicus himself, when he was Professor at the College. He imbibed the first idea of this syftem from Dominic Maria de Ferrara, when he attended his course of astronomy at Bologna. It is well known that he dedicated his work to Paul III. and that he was excited to publish it by Schomberg Cardinal of Capua, who offered to defray the expence, Cardinal Cufa, who preached the necessity of reforming the Calendar to the Lateran Council, received no rebuke for reviving and maintaining, almost a century before Copernicus, the opinion of the ancients respecting the motion of the earth. But an incontestible proof, that, in the affair of Galileo, his person only was attacked. and not his system, is, that Pope Urban VIII. obtained Father Castelli from the Grand Duke, by preffing folicitations, to make him Professor of Mathematics in the College of Rome, though he was well known to be an intimate friend of Galileo, and a zealous defender of his opinions. fame Pontiff favoured and efteemed Virginio Cesarini, Member of the Academy of the Lincei, who from the extent of his knowledge, and his great youth, was deemed another Picus de la Mirandola. Cesarini had cultivated Latin and Italian poetry with fuccess, as is obvious from his Elegies, in the first of which he mentions the earth's movement, whence he takes occasion to make a sublime eulogium on Galileo, whose intimate friend he was. This circumstance, however, made no alteration in the esteem and attachment which the Pope retained for him.

In the present century the Popes have never ceased to protect, and load with benefits, the celebrated institution of Bologna, which has purfued the science of natural philosophy with equal zeal and fuccess. But we shall now, no doubt, see it flourish

and throughout the whole Ecclefialtical State, from the protection of tions, has no amusements but the study the reigning Pope, and the activity of of altronomy, natural history, and the Cardinal Zelada, his minister, who,

amidft the most important occupanoblest monuments of antiquity.

ON THE ATMOSPHERE OF THE PLANETS.

lyftem-building; but before we attempt so explore or erect new fyf- Something like this feems to be tems, we hould be well acquainted confirmed by observation; for Mer. with our own.

To alcertain the existence of atmospheres in the several planets of our fystem, and to examine their natures, is a fubject, well worthy the attention of astronomers, for a planet's enjoying an atmosphere, can

only render it habitable.

every kind of matter, on the planet Mercury, is in a state of fusion, in consequence of the extremity of heat it must experience from its vicioity to the Sun, and owing to the opposite caple that there can be nothing fluid in Saturn: but furely we need not go fo far, to look for such effects: if the diffance or nearness of the Sun alone were concerned in producing them, these extremes would be felt in Mars and Venus; nay the earth, removed a few of its diameters nearer to, or farther from the Sun, would experience them : but neither the heat or light of that luminary can be efficient, without the intervention of an Atmosohere ; and as that is dense or rare, fowill these be augmented or lessened.

Every one knows the effect of rarified air in admitting cold, and of air condensed in conducting heat; and that high mountains, from this cause, are covered with snow, even in the torrid zone, while the heat is insupportable in the valleys: may not the fame cause regulate the heat and light of the Sun, in the feveral planets of our fystem? Mereury, though so near his orb, will suffer his rays to pass through a very rare atmosphere, without much condensation, while those rays will be collected, as in the focus of a lens, paffing through the dense medium of that of Saturn. Thus will ing close to her darkened circumfe-

MODERN discoveries in astrono-each planet enjoy an equal and suf-my have opened a wide field for ficient portion of the vivifying influence of their common luminary. cury and Venus are found to have very rare and ferene atmospheres, whill those of Mars, Jupiter, and Saturn, from their moving macule and ever changing belts, are supposed to be exceedingly denfe; and would not the earth, if viewed from a neighbouring planet, exhibit appearances It is a common supposition, that somewhat similar to those of Jupiter? Our equatorial belt would feem bright and ferene while near the tropics; and in various parts of the temperate zones, cingula and maculæ would appear continually changing; there may even exist some general law of nature to cause this, perhaps somewhat anslogous to that which governs the course of the planets, as to the time they move sound their centre, in proportion to the distances they are from it.

> The Moon was thought to have no atmosphere; but Herschel, by his discoveries of volcanoes on her body, has confused that opinion; for fire cannot exist without air. But there also seem to be other proofs. In a total eclipse of the Sun, a luminous ring is observed to encircle the dark body of the Moon: now as the plane of the Moon's disk, is apparently latger than that of the Sun, this luminous ring cannot be owing to any part of the Sun not being eclipsed; we must therefore ascribe it to the atmosphere of the Moon absorbing and reflecting the rays of light, as ours does in twilight.

I myself have observed on a clear night, the Moon being in her first quarter, and her unenlightened porti plainly visible to the naked eye, aluminous ring, just perceptible, adher-

rence ; but whither this was a deceptio owing to any refraction caused by bur air, or the Moon's real atmofphere faintly illuminated, I cannot

pretend to fay.

The fame authority which has denied an Atmosphere to the Moon, denies also meteors and water; and supposes the shaded parts of her disk, to be hollows and deep pits, and not fers; but furely with no great reason: for if refemblances in optics were not fo fallacious, even our fea, viewed from an high cliff, has an appearance not unlike those shades that in some parts will feem of a darker hue than others. But further, on examining the Moon just as she enters her third quarter, the shaded parts will be feen separated from those which are totally unenlightened, by a line perfectly even; whereas, the separation of the bright parts will be broken and rugged: now if these were pits and hollows, and not feas, this line of feparation would not be perfectly even, and would coincide with the arch of the Moon's enlightened limb.

Thus, without indulging any great flights of imagination, we may conclude, that all the planets of our system are as well adapted for the habitation of animals, as this of ours is; that if they contain animals, these must be of a nature fimilar to fuch as inhabit our globe, because the materials which compose theirs, and their means of existence, are similar; that supposing the earth to be as a medium in the fystem, the inferior planets, or those between us and the Sun, may possibly contain animals of a finer organization, and those again beyond our orbit, of a groffer than ours; and, finally, that a part of those animals may be supposed to be rational, as fome of their planets are furnished with a splendid paraphernalia of Satellites, which would be of no use to irrational creatures.

Edinburgh, Nov. o.

Experiments and Observations on the Dissolution of Metals IN ACIDS, AND THEIR PRECIPITATIONS: WITH AN ACCOUNT OF A NEW COMPOUND ACID MENSTRUUM, USEFUL IN SOME TECHNICAL OPERATIONS OF PARTING METALS.

BY JAMES KEIR, ESQ; F. R. S.

(Continued from Page 188.)

PART II.

An Account of a new process for separating filver from copper.

HE properties of this liquor, in dissolving filver easily, without acting on copper, have rendered it capable of a very ufeful application in the arts. Among the manufactures at Birmingham, that of making veffels of filver plated on copper, is a very confiderable one. In cutting out the rolled plated metal, into pieces of the required forms and fizes, there are many shreds, or scraps as they are called, unfit for any pur-Vol. VII.

thod of parting these two metals, so as not to lofe either of them, is an object of some consequence to the manufacturers. For this purpose two modes were practifed: one, by melting the whole of the mixed metals with lead, and feparating them by eliquation and tefting; and the fecond, by diffolving both metals in oil of vitriol, with the help of heat, and by separating the vitriol of filver, which is afterwards to be reduced and purified. In the first of these methods. there is a confiderable wafte of lead and copper by dissolving it in water. pole, but the recovery of the metals, from the vitriol of filver, which is afby separating them from each other. terwards to be reduced and purified; The easiest and most economical me- and in the second, the quantity N.

of vitriolic acid employed is very quainted with the properties of this great, as much more is diffipated in compound, they would probably have the form of volatile vitriolic, or ful- bestowed on it the appellation of aqua phurous acid, than remains in the reginae. composition of the two vitriols.

Some years ago, I communicated to an artist the method of effecting the feparation of filver and copper, by means of the above mentioned compound of vitriolic acid, and nitre; and, as I am informed, it is now commonly practifed by the manufacturers in Birmingham. I have no doubt but it is much more economical, and it is certainly much more eafily executed than any of the other methods: for nothing more is required than to put the pieces of plated metal into an earthen glazed pan: to pour upon them some of the acid liquor, which may be in the proportion of eight or ten pounds of oil of vitriol, to one pound of nitre: to ftir them about, that the furfaces may be frequently exposed to fresh liquor, and to affift the action by a gentle heat from 100° to 200° of Fahrenheit's When the liquor is nearly faturated, the filver is to be precipitated from it by common falt, which forms a lutu cornia, easily reducible by melting it in a crucible, with a fufficient quantity of pot-ash; and, lastly, by refining the melted filver, if necesfary, with a little nitre thrown upon In this manner the filver will be obtained fufficiently pure, and the copper will remain unchanged. Otherwife, the filver may be precipitated in its metallic state, by adding to the folution of filver a few of the pieces of copper, and a sufficient quantity of water to enable the liquor to act upon the copper.

The property which this acid mixture possesses of dissolving filver with great facility, and in confiderable quantity, will probably render it an useful menstruum in the separation of filver from other metals: and, as the alchemists have distinguished the peculiar folvent of gold under he title of aqua regis, a name fufficiently diftinctive, though founded on a fanciful allulion, fo, if they had been ac-

PART III.

The change of properties communicated to the mixture of vitriolic and nitrous acids by phlogistication.

20. The above described com. pound acid may be phlogisticated in different methods, of which I shall

mention three.

fumes a violet colour.

1st, By difgesting the compound acid with fulphur, by means of the heat of a water bath, the liquor dif. folves the fulphur with effervescence, loses its property of yielding white fumes; and if the quantity of fulphur be fufficient, and if the heat applied be long enough continued, it exhibits red nitrous vapours, and af.

andly, If, instead of dissolving ni. tre in concentrated vitriolic acid, this acid be impregnated with nitrousgas, or with nitrous vapour, by making this gas or vapour pals into the acid, this compound will be phlogifticated, as it contains not the entire nitrous acid, but only its phlogifticated part, or element, the nitrous gas, without the proportion of pure air necessary to This impregnaconstitute an acid. tion of oil of vitriol with nitrous ga, or nitrous vapour, was first described, and some of the properties of the impregnated liquor noticed by Dr. Priestley. (See Experiments and Obfervations on Air, vol. III. p. 129,

and 247.) 3dly, By fubflituting nitrous ammoniac instead of nitre, in the mix-

ture with oil of vitriol.

21. The compound prepared by any of these methods, but especially by the first and second, differs confiderably in its properties, with regad to its action on metals, from the acid described in the first fection. It has been observed, that the latter compound has little action on any metals but filver, tin, mercury, and nickel On the other hand, the phlogifticated compound not only acts on thefe, but also on several others. It forms with

bably have beautiful role-coloured folution, on of aqua without application of any artificial heat, and in time a rose-coloured faline precipitate is deposited, which nmunicatel is foluble in water with confiderable effervescence. It dissolves copper, and acquires from this metal, and allo from regulus of cobalt, zinc, and lead, pretty deep violet tinges, ch I shall bismuth and regulus of antimony

were also attacked by this phlogisticated acid.

To ascertain more exactly the effelts of this phlogisticated acid on fome metals, I made the following experiments, with a liquor prepared by making nitrous gas pass through oil of vitrol during a confiderable

22. To 200 grain-measures of the oil of vitriol impregnated with nitrious gas, put into a retort with a long neck, the capacity of which, induding the neck was 1150 grainmeasures, I added 144 grains of standard silver, and immersed the mouth of the retort in water, under an inverted jar filled with water, to catch the gas which might be ex-The acid began to diftricated. folve the filver with effervescence by application of heat: the folution became of a violet colour, and the quantity of nitrous gas received in the inverted jar was 14700 grainmeasures, upon weighing the filver remaining, the quantity which had been dissolved was found to be 70 grains, when water was added to the folution, an effervescence appeared, but only a very small quantity of gas was extricated by means of the water, a white faline powder of filver, foluble in a larger quantity of water, was precipitated from the folution. The folution of filver when faturated and undiluted, congeals readily in cool temperatures, and, when diluted to a certain degree with water, gives foliated crystals.

23. In the fame apparatus, and in the fame manner, 100 grain-meafores of this impregnated oil of vitriol were applied to iron. An eftervescence appeared without appli-

cation of heat, the furface of the iron acquired a beautiful role colour, or redness mixed with purple; and this colour gradually pervaded the whole liquor, but disappeared on keeping the retort fome time hot in water, notwithstanding a considerable apparent effervescence, the quantity of air expelled into the inverted jar was only 400 grain-measures, of which I was nitrous, and the reft phlogisticated, the folution was then poured out of the retort, and the iron, and 200 grains of water were added to it, upon which a white powder was immediately precipitated, which, re-dissolved with great effervescence. When 2000 grainmeasures of nitrous gas had been expelled into the inverted jar, without application of heat, the retort was placed in the water bath, the heat of which rendered the effervefcence fo ftrong, that the liquor boiled over the neek of the retort, fo that the quantity of gas extricated could not be ascertained.

24. In the fame manner 11 grains of copper were diffolved in 100 grain-measures of impregnated oil of vitriol. The folution was of a deep violet colour, and at last was turbid. The quantity of nitrous gas expelled into the inverted jar during the operation was 4700 grainmeasures, when the copper was removed, and 200 grains of water were added to the folution, an effervelcence took place, 1700 grainmeasures of nitrous gas were expelled, and the folution then ac-

quired a blue colour.

25. In the same apparatus and manner, 100 grain-measures of the impregnated oil of vitriol were applied to tin, which was thereby diminished in the weight of 16 grains, while the liquor acquired a violet colour, became turbid by the fuspension of the calx of tin, and a quantity of nitrous gas was thrown into the inverted receiver equal to 4100 grain-meafures, without application of heat, and another quantity equal to 4900 grain-measures,

water bath.

26. Mercury added to the impregnated oil of vitriol formed a thick white turbid liquor, which was rendered clear by addition of unimpregnated oil of vitriol. In a little time this mixture continuing to act on the remaining mercury, acquired a purple colour. The mercury acted upon funk to the bottom of the glass in the form of a white powder, and the purple liquor, when mixed with a folution of common falt in water, gave no appearance of its containing any mercury in a dissolved state.

27. The nitrous gas with which the oil of vitriol is impregnated, thews no disposition to quit the acid by exposure to air; but, on adding water to the impregnated acid, the gas is expelled fuddenly with great effervescence, and with red fumes, in confequence of its mixture with

the atmospherical air.

Upon adding 240 grains of water to 60 grain measures of impregnated oil of vitriol, 2300 grains of nitrous gas were thrown into the receiver; but as the action of the two liquois is instantaneous, the quantity of gas expelled from the retort, before its neck could be immerfed in water, and placed under the receiver, must have been confiderable. The whole of the gas, however, was not extricated by means of the water, for the remaining liquor diffolved 5 grains of copper, while 800 mea-fures of nitrous gas were thrown into the retort.

28. The following facts principally are established by the preceding experiments, 1. That a mixture of the vitriolic and nitrous acids in oil of vitriol and nitre, without

after the retort was put into the faculty of dissolving filver copiously. 2. That it acts upon, and principally calcines tin, mercury, and nickel, the latter of which, however, it dissolves in small quantity, and that it has little or no action in other metals. 3. That the quantity of gas produced, while the metal is dissolving, is greater, relatively to the quantity of metal dissolved, when the proportion of nitre to the vitriolic acid is fmall than when it is large, and that when the metals are diffolved by mixtures containing much nitre, and with a fmall production of gas, the folution itself. or the metallic falt formed in it, yields abundance of gas when mixed with water. 4. That dilution with water renders the concentrated mixture less capable of dissolving filver, but more capable of acting on other metals. 5. That this mixture of highly concentrated vitriolic and nitrous acids acquires a purple or violet colour when phlogisticated; either by addition of inflammable fubstances, as fulphur, or by its action on metals, or by very ftrong impregnation of oil of vitriol with nitrous gas. 6. That this phlogiftication was found to communicate to the mixture the power of disfolving, though in small quantities, copper, iron, zinc, and regulus of cobalt. 7. That water expels from a highly phlogisticated mixture of concentrated vitriolic and nitrous acids, or of oil of vitriol impregnated with nitrous gas, a great part of its contained gas; and that therefore this gas is not capable of being retained in fuch quantity by dilute as by concentrated acids. Water unites with the mixture of a concentrated state, has a peculiar any confiderable effervescence.

In visiting the churches of Barcelona, an observation is confirmed, which had occurred even in the post contemptible of the country villages fouth of the Pyrences. It is evident that all their decorations were invented about the beginning of the fixteenth century, after the gold and filver of America had been brought to Spain, and every altarpiece, with every column, shews that their improvement in tafte did not keep pace with their increase of wealth; riches came upon them by furprife, and found them unprepared to make a proper use of the abundant treasure. Hence even the composite and the Corinthian pillars are loaded with new ornaments, and whether fluted or contorted, they are almost hid by the multitude of angels fluttering round them, or by cherubs climbing up the branches; and the whole of this prepofterous affemblage is covered with one glare of gold. The present generation is enlightened, and their tafte is much refined; yet they want refolution to reform abuses, and to strip off those ornaments to which the blind zeal and devotion of their forefathers have given fanction. One of their best writers has remonstrated, and his remonstrances have engaged the attention of government, to make wife regulations for the future.

They have in this city an academy for the noble arts, open to all the world, in which all who attend are freely taught drawing, architecture, and sculpture, under the direction of D. Pedro Moles, and others, who, like him, excel in the branches they

profess. For this purpose, they have feven spacious halls, furnished at the king's expence, with tables, benches, lights, paper, pencils, drawings, models, clay, and living subjects; they assemble in the morning from ten to twelve, and in the evening from fix to eight, in winter. and from eight to ten in the fummer.

This academy is well attended; I counted one night upwards of five hundred boys, many of them were finishing designs, which shewed cither superior genius, or more than common application. It is not to be imagined that all these boys, or perhaps any of them, are destined to be painters, this was not the intention of government, much less of Count Campomanes, who fuggested the institution. Most, if not all these youths, are apprenticed to trades; and it is well imagined, that every other art may receive fome affistance from this, whose peculiar property it is to excel in imitation, and much wanted in England. Not only the sculptor, the architect, and the engineer, but the coachmaker, the cabinet-maker, the weaver, nay even the taylor and the haberdasher, may derive great advantages from that accuracy of fight, and that fertility of invention, which are acquired by the practice of drawing and defigning. D. Pedro Moles is an artist whose works have been univerfally admired for the beauty of his stroke, and the force of his expression. It is a pity that the graver was ever taken from his hands; he may perhaps be more usefully employed in superintending this academy, but as an engraver, he would have acquired a more lafting fame, and have made a better provision for his family.

One of the feven halls is fitted up as a nautical school, and is provided with every thing which is needful to teach the art of navigation. The fludents, who at preferit are only thirty-fix, affemble every morning from eight to ten, and every evening from three to five. Since the first establishment of this useful feminary, they have fent out more than five hundred pilots, qualified to navigate a vessel to any quarter of the globe. Equally well furnished with the preceding, and equally well conducted, is the milistary academy, in which there are three magnificent apartments for the fludents to purfue their fludies, from the first-elements of the mathematics, to the higher branches of their

profession.

Befides these institutions for the instruction of such as are devoted to arts or arms, there are not wanting some of more general utility, accessible to all the citizens without distinction. These are a cabinet of natural history, and the public libraries, of which there are four: three general, and the other confined to medicine and furgery; the cabinets belong to D. Jaime Salvador. From the reports of this collection, I had formed high ex-pectations, but I must confess my-felf distaistied; some thirty or forty years ago, it may have been worthy of attention, but the science itself, and the cabinets of the curious are fo much improved, that coldections, which at remoter periods excited wonder, are in the present day juftly regarded with cold indifference. The general libraries are those of the Bishop's College, of the Carmelites, and of the Dominicans. This last I found most worthy of attention, as containing more modern books of value than either of the former. Among these, some of the most confiderable were the ruins of Palmira; Raphael's Heads, by numens de la Greece; Histoire genealogique de la Maison Royale de ner took up my memorandum book, illust. ex Barbadica gente: Danu- from either at the time. Fifteen bius Pannonico Myficus. These months after this when I returned may ferve to shew that the collec- to Barcelona, he smiled and faid,

whatever studies a man may be defirous of purfuing, he will find in one or other of these libraries the best books, to which he may have accels fix hours every day, excepting holidays. In the convent of the Dominicans, there is one apartment filled entirely with books prohibited by the inquisition, and, in order that no one may be tempted to perufe them, all the vacant spaces are filled with devils cracking human bones; it is to be fuppoled heretics; left, however, this fight should not suffice to check a prying disposition, they are well fecured by lock and key, and no one has access to these without a fpecial licence. In the cloifter of the Dominicans, there are morethan five hundred records of fentences passed on heretics, containing their name, their age, their occupation, their place of abode, the time when they where condemned, and the event, whether the party were burnt in person or effigy, or whether he recanted and was saved, not from the fire and the faggot, for then he might relapfe, but from the flame of held; most of these were women. The first date is A. D. 1489. and the laft, 1726. Under each inscription there is a portrait of the heretic, fome half, others more than three parts devoured by devils. I was to much struck with the fantaftic forms which the painters had given to their dæmons, and the strange attitudes of the heretics, that I could not relift my inclination to copy fome of them, when no one was walking in the cloifter. Some time after this, fitting with one of Fidanza; Duhalde's China; Mo- the inquifitors, who did me the honour of a vifit, he in a careless man-Prance, and des anciens Barons, and as chance would have it, open-par le P. Anfelme; Antichita di ed precifely on the leaf which con-Ercolano; Muratori Thefaur, vet. tained my drawings: I laughed; he Inferiptionum: Numifinata Vir. coloured; but not one word escaped tion is not contemptible. During my residence at Barcelona. I had an opportunity of feeing all the courts of the inquintion affembled in a grand proceilion to celebrate the feast of St. Pedro Martyr, their Patron Saint, in Church of St. Catharine of the Dominicans. Happy had it been for Christendom, if all their festivals had been as innocent as this. It is however, univerfally acknowledged for the credit of the corps, at Barcelona, that all its members are men of worth, and most of them distinguished for humanity.

Vifiting the churches at all hours, whenever any fervice was performed, I made a party with some friends to hear penitential fervice in the convent of St. Felipe Neri, on Friday evening of April 28. The first day evening of April 28. part of the Miserere was no sooner ended, than the doors were flut, the lights were extinguished, and we remained in perfect darkness; distract the mind, the attention was

in the Miserere, which they sung with pleasing folemnity; at first with foft and plaintive notes; but having laid bare their backs, and prepared them for the foourge, they all began at the fame instant to use the discipline, raising their voices, and quickening the time, increasing by degrees both in velocity and violence, scourging themselves with greater vehemence as they proceeded, and finging louder and harsher, till at the end of twenty minutes. all distinction of found was lost, and the whole ended in one deep groan. Prepared as I had been to expect fomething terrible, yet this so far furpaffed my expectation, that my blood ran cold, and one of the company, not remarkable for fenfibility of nerves, being thus takers by furprise, burst into tears.

This discipline is repeated every Friday in the year, oftener in Lent, and is their daily practice during the holy week. I was not at liberty to ask what advantage they derived, at this moment, when the eye or what benefits they expected to could no longer find an object to receive from this feverity; yet, from the prevalence of vice in awakened by the voice of harmony, Spain, I fear this practice has little if for the whole congregation joined any tendency to reform their morals.

ACCOUNT OF THE BALAGANS AND YOURTS, OR HOUSES IN KAMTSCHATKA.

FROM LESSEP'S TRAVELS.

the first during summer, and netreat to the last in winter. As it is thought defirable that they fhould the Russian peasants, they are prohibited, in this fouthern part of more yourts, or fubterraneous habi- bearing upon the rafters. we-houses.

The balagans are elevated above

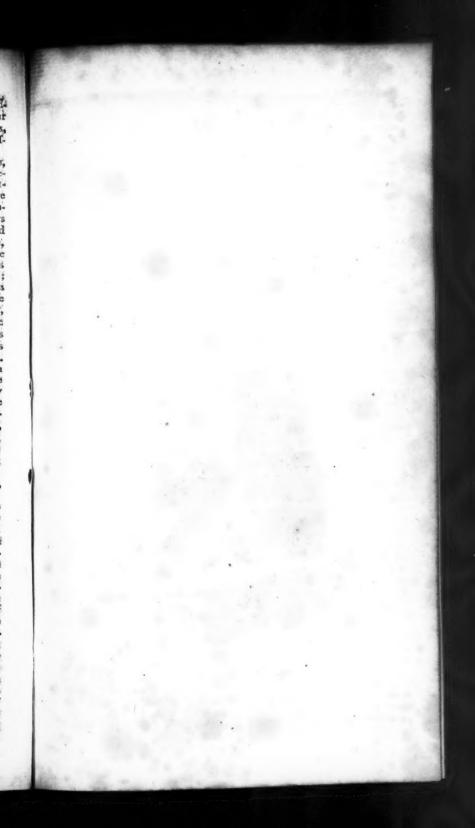

HE Kamtschadales lodge in twelve or thirteen feet high. This rough fort of colonade supports in the air a platform that ferves as a floor to the whole building, which be brought gradually to refemble confifts of a roof in the shape of a cone, covered with a kind of thatch, or dried grafs, placed upon poles Kamtschatka, from constructing any fastened together at the top, and mtions; these are all destroyed at at once the first and last story; it present, a few vestiges only remain forms the whole apartment, or rather of them, filled up within, and ap- chamber; an opening in the roof pear externally like the roofs of our ferves inflead of a chimney to let out the smoke, when a fire is lighted to drefs their victuals: this cookery the ground upon a number of posts, is performed in the middle of the placed at equal distances, and about room, where they gat and sleep pell-

gust or scruple. In these apartments windows are out of the question; there is merely a door, so low and narrow, that it will fcarcely fuffice to admit the light. The ftair-cafe is worthy of the rest of the building; it confills of a beam, or rather tree, jagged in a flovenly manner, one end of which refts upon the ground, and the other is raifed to the height of the floor: it is placed at the angle of the door, upon a level with a kind of open gallery that is erected before it. This tree retains its roundnefs, and prefents on one fide fomething like steps, but they are so incommodious that I was more than once in danger of breaking my neck. In reality, whenever this vile ladder turns under the feet of those who are not accustomed to it, it is impossible to preserve an equilibrium; a fall must be the confequence, more or less dangerous in proportion to the height; when they wish persons to be informed that there is nobody at home, they merely turn the stair-case with the steps inward.

Motives of convenience may have fuggested to these people the idea of building fuch strange dwellings, which their mode of living renders necessary and commodious. Their principal food being dried fish, which is also the nourishment of their dogs, it is necessary, in order to dry their fish, and other provisions, that they should have a place sheltered from the heat of the fun, and at the same time perfectly exposed to the air. Under the colonades, or rustic porticos, which form the lower part of their balagans, they find this convenience, and there fnow; it is faid, however, that these they hang their fish, either to the enclosures formerly served as ramcieling or to the fides, that it may parts to defend these people against be out of the reach of the vora- their enemies. We have no fooner ciousness of their dogs. The Kamts- descended these savage abodes, than chadales make use of dogs to draw we wish ourselves out again; the their sledges; the best, that is, the view and the smell are equally offenmost vicious, have no other kennel five. The interior part confists of than what the portico of the bala- one entire room, about ten feet gans affords them, to the posts of high; a bench five feet wide, and

mell together, without the least difgust or scruple. In these apartments windows are out of the question; there is merely a door, so low and parrow, that it will scarcely suffice

> I shall now speak of the yourts. which I have not yet described, deferving as they are of particular attention. These strange houses are funk in the earth, as I before obferved, and the top which appears above ground is like a truncated cone: to form a just idea of them. we must conceive of a large square hole about twelve or fourteen yards in diameter, and eight feet deep! the four fides are lined with joifts or boards, and the interffices of these walls are filled up with earth, ftraw. or dried grafs and stones. In the bottom of this hole various posts are fixed, that support the cross beams upon which the roof refts. The roof begins upon a level with the ground, and rifes four feet above it; it is two feet thick, has a very gradual flope, and is made of the fame materials as the walls. Towards the top is a fquare opening, about four feet long and three wide. which ferves as a passage for the fmoke, and an entrance to the yourt, where the women as well as the men go in and out by means of a ladder, or notched beam, that is raised to a level with this opening. There is another very low entrance in one fide of the yourt, but it is confidered as a kind of difgrace to make ufc of it. I shall terminate the description of the exterior part of these habitations by adding, that they are furrounded with tolerably high palifades, doubtless as a protection against the gales of wind, or falls of

A SHORT ACCOUNT OF SENECA.

WITH A BEAUTIFUL ENGRAVING FROM AN ANCIENT STATUE.

in philosophy by Socion of Alex- Helvia. andria and Photinus, both celebrated In this exile he remained five Caligula, who aspired also at the the imperial throne. nicius, one of his benefactors, this him. Vot. VII.

UCIUS Annæus Seneca, was afpersion, though perhaps unjust, was born at Cordova, in Spain, believed by his enemies. He was about fix years before the Christian therefore benished to the Island of ara. He was instructed in elo- Corsica, and it was there that he quence by his father, Hyginius wrote his Treatife on Confolation, Cestius, and Afinius Gallus; and which he addressed to his mother

Roics. Having practifed for some years, and had not a revolution at time that abstinence which was en- Court occasioned the fall of Messajoined by the Pythagorean feet, that lina, might perhaps have ended his is to fay, after having abstained days in it. But when Agrippina from every thing endowed with married the Emperor Claudius, the life, he devoted himself to the bar, recalled Seneca, in order to entrust where his pleadings were admired; him with the education of her fon but fearing to excite the jealoufy of Nero, whom she wished to raise to While this glory of being accounted eloquent, young prince followed the advice, he quitted a path which it was very and obeyed the instructions of his dangerous for him to purfue, under preceptor, he was the darling of a prince meanly envious. After Rome, but Poppea and Tigillinus this he turned his thoughts towards having acquired a complete afcensome public office, and obtained dency over him, he became a difthat of quæstor. It was imagined grace to human nature. Seneca's that he would have risen much virtue seemed to be a continued higher, but being accused of carry- censure of his vices, and on this acing on an illicit correspondence count he ordered one of his freedwith Julia Livilla, the wife of Vi- men, named Cleonice, to poilon This wretch not being able

to accomplish his base purpose, because Seneca, apprehensive of danger, drank nothing but water, Nero involved him in the conspiracy of P fo. Seneca, however, was only fuspected, no proof being ever brought against him that he had taken any share in this plot. He was only named by Natalis, one of the principal confpirators, who did not even exhibit a very strong charge against him. He faid that he had been fent by Pifo to Seneca, to reproach him for not coming to fee them, and that Scheca replied, that it was not advantageous for the interest of either party to hold any correspondence together; but that his fafety depended on the life of Pifo. Granius Silvanus, the tribune of a prætorian cohort was commiffioned to inform Seneca what Natalis had deposed, and to ask him if he acknowledged the truth of his relation. Seneca, either by chance or through defign, returned that day from Campania, and Ropped at a country house which he had in a place four leagues distant from Rome. The tribune arrived there in the evening, and posted guards all around the house. Finding Seneca at table with his wife Paulina, and two friends, he communicated to him the Emperor's orders. nece replied, that the relation of Natalis was true; but that for his part he had excufed himself merely on account of bad health, and of his fondness for repose and tranquillity; that he had no occasion to make his fafety depend upon the life of any individual; that his dispofition did not incline him to flattery, and that no one knew him better than Nero, to whom he had exhibited more figns of freedom, than When the tribune of fervitude. returned with this answer, which he delivered to Nero in the presence of Poppea and Tigillinus, who formed his privy council when he was in his paroxysms of fury, Nero asked Granius if Seneca was preparing to die. "He shewed no fign

" of fear," replied the officer : " 1 " faw no appearance of dejection " either in his words or counter " nance," " Return then," faid the emperor, " and fignify to him that " he is fentenced to die." The philosopher finding that he was cone demned to lose his life, but in what ever manner he himfelf should chuse, feemed to receive his doom with joy. He requested leave to dispose of the immense wealth which he had amassed, by preaching up the contempt of riches, but this was refused. He then faid to his friends. that fince it was not in his power to give them part of what he thought he possessed, he would at least leave them his life as a model, and that by closely imitating it, they would acquire among people of worth im-mortal glory. As he faw them fled tears, he endeavoured to recall to their minds sentiments of firmness, by exhortation, or even by gentle reproaches, "Where," faid he to them, " are those maxims of wisdom " which you have fludied? When then will you make use of those reflections, by which you have " endeavoured to secure yourselves " against the strokes of fate? Were "you ignorant of the cruelty of " Nero? After killing his mother and brother, nothing remained " but to add to his other crimes the of death of him who had the care of " his education." - Paulina his wife fhed tears. Seneca endeavoured to allay her grief; " Do not," faid he, " fpend your days in eternal afflic-Keep always in remem-" tion. " brance the virtuous life which ! This will be a conlo-" have led. "lation worthy of a great mind, " which ought to foothe your grief " for the loss of a husband." Paulina replied, that fhe was refolved to die with him, and she asked the officer who was prefent to affift her in the execution of her defign. Seneca confidered voluntary death as an heroic action. He was afraid also to leave a person whom he held so dear, exposed to a thousand severities

"nels of life. You prefer the glory "of dying. I do not envy you the "honour of fo noble an example. "We shall die perhaps with the # fame constancy; but the glory on "your fide is much more noble and "complete." After this they both caused the veins of their arms to be opened at the same time; but Nero, who loved Paulina, gave orders to lave her life. Seneca was fo much extenuated by continued abflinence, that the blood did not flow from his veins: he had recourse therefore to a warm bath, by the vapour of which, mixed with that of thought.

after he was gone. He consented some liquors, he was stiffed. He therefore to Paulina's defire, "I conversed long and very sensibly "have shewn you," faid he, "what whilst he was waiting for death, and " might have sweetened the bitter- what he then faid was collected by his fecretaries, and published afterwards by his friends. This difmal fcene took place in the fixty-fifth vear of the Christian æra, and in the twelfth year of the reign of Nero.

The annexed figure of Seneca is taken from an antique statue, which, according to Rossi, was in the Spada palace at Rome. The philosopher is here represented in a fitting polture, which among the Romans was a mark of dignity, and his whole attitude feems to display deep study, contemplation, and intenfenels of

I fend you, exactly as I find it in an old volume of manuscripts. A Description (as it is called) of the King of Sweden, (Charles XII.) in the year 1707.

mondrets.

My LORD.

WILL tell you as a particular I friend, that even without leave, (which should not have been) I did venture the other day to ramble into Saxony, to fatisfy my curiofity in feeing those different kings there; and to penetrate as far as I could, how matters stood here, and how fate is like to be determined by that gothic hero, who with a handful of men, makes himself dreaded and courted by all the powers of Europe. As for his person, he did not answer the description I had of him. He immoderately dirty and flovenly; his behaviour and carriage more ruftic than you can imagine in fo young a man. And that the outhde of his quarters; should not belie the infide, he has chose the dirtiest of all Saxony, and one of the faddest houses. The cleanliest place is the court before the house, where

horses, and is up to the knees in dirt, where his horses stand, with hardly any halters, and facking instead of cloths, without either rack or manger. The horses have rough coats, thick bellies, thin buttocks, and fwitch tails: the grooms that look after them feem not to be better cloathed nor kept than their horses, one of which always stands ready for the mighty monarch, who runs out commonly alone, and bestrides his steed, and away he gallops, before any body is ready to is a tall handsome gentleman, but follow him. Sometimes he will go ten or twelve of their country miles in a day, (which is forty-eight or fifty English miles) now in the winter time, bespattered all over with dirt like a postillion.

I should make my letter too long if I told you his dress, his eating, drinking, and fleeping: but not to let it entirely alone, I'll tell you his every body is to alight off their coat is plain blue, with ordinary Sistemited of a Handish, & Ooden

brass buttons; the skirts put up behind and before, which shews his nafty old leather waistcoat and breeches, and which they tell us is fometimes to greafy they may be fried; but when I faw him they were almost new, for he had been gallanting a little before, and had been to fee king Augustus's queen, upon her return to Leipfick; and to be very fine, had put on these new leather breeehes .- Spoke not above three words to her, but talked to a foolish dwarf she has for about a quarter of an hour, then left her. He wears a black crape cravat; but the cape of his coat is buttoned on fo close about it, you cannot see whether he has any or no. His thirt and wriftbands are commonly very dirty, for he wears no gloves or ruffles on horfeback : his hands are commonly of the fame colour with his wriftbands, fo that you can hardly distinguish them. His hair is of a light brown, very greafy and very fhort; never combed but with his fingers.

He fits upon any stool or chair he can find: he begins his dinner with a great piece of bread and butter, which he spreads with his thumb: having stuck his napkin under his chin, he drinks with his mouthful, out of a great filver old-fashioned beaker, fmall beer, which is his only liquor at his meals; he drinks about two Engltsh bottles, for he empties his beaker twice: between every bit of meat he eats a piece of bread and butter. He is never more than a quarter of an hour at dinner, eats like a horse, speaks not a word all the while; as foon as he rifes, his drabands, or life-guards, fit down at the fame table, to the fame victuals.

His bed chamber is a little dirty room, with bare walls; no sheets or canopy to his bed; but the same quilt that lies under him turns up over him, and to cover him: at his bed's feet stands his close-stool, a sad dirty wooden thing.

His writing table is only a flight deal, with only a flick to support it; and instead of a standish, a wooden thing, with a fand box of the fame. He has a fine gilt bible by his bedfide, which is the only thing which looks fine in his equipage.

He is a very handfome man, well fhaped, and a very good face; no ftern countenance; but he is very whimfical and positive, which makes all the allies afraid of him, for he risques himself and his army as casy as another would fight a duel.

He has not shewed much generosity to king Augustus, who sent a carte blanche to make peace, and to recommend himself to his friendship; but he does still every day very hard things to that poor prince, who he treats always like one he has entirely in his power.

King Augustus is as well bred a man as you shall see; very obliging in his person and behaviour, and liked by every one. But now he pays for all his false unfaithful policies, and finds too late that one prince should not intirely submit to another.

Although my letter is too long already, I will give you a short account of the Polish court of king Stanislaus, who I found at Leiplick; where I not only faw that king, but he very civilly came and spoke to me and my friend, as being ftrangers. His court has a much better air than that of his master. His mother and wife were there, a couple of well bred women, well dreffed, and spoke good French. He is tall, young, and handsome; wears whifkers, in the Polish dress, but inclinable to be fat, and a little upon the dirty, as all the Poles are. He was lodged in a very pretty little castle, belonging to king Augustus, but against that king's will, who will never fee him, and cannot bear to Rear him spoke of; and yet the Swedes would oblige him to fee him, which they fay he ought to do by the treaty.

You used to tell me, my dear lord, you loved to hear of my rambles, and I believe this will please you better than my former, being a very true description of the mighty and dirly monarch.

SINGULAR CHARACTERS AND ANECDOTES OF THE COURT OF LOUIS XIV. KING OF FRANCE.

BY M. ANQUETIL.

Of the Abbé COSNAC. HE Abbé Coinac who was in the train of Louis XIV. was the younger fon of a very good family in Limoufin. I shall make my fortune,' faid he, as he left his father's house, to come to Paris; and though of an ungraceful figure, without the advantages of a liberal education, and indeed, destitute of every recommendation but his name, he actually made his fortune. 'He determined on a clerical life, and, during the civil wars, infinuated himfelf into the service of the Prince of Conti; who, on account of the awkward-'ness of his shape, had been destined to the fame profession. At the age of twenty-two, the Abbé became an active negociator, contributed to the peace of Bourdeaux, and afterwards to the marriage of the Prince with one of Mazarine's nieces. He next became first gentleman to the Prince, and acquired great credit with the Minister. But, his object was a bishoprick; with a view to which he preached at Court, and practifed every other art likely to promote his purpose. Unfortunately, he had enemies in the service of the Prince of Conti, who fought to disappoint his wishes, and succeeded fo far, as to prepoffels the Prince against him. While his affairs were in this state, the Bishoprick of Valence fell vacant; Cosnac hastened to the Prince, and begged his interest for it. The Prince seemed but little disposed to listen to him." "What! (cries "the Abbé) do you answer me thus coldly, my Lord,—me, the con-fident of your feerets? Beware! Let it not be known, that you "have answered in this ambiguous manner, on an occasion in which the interest of your principal domeltic is so deeply concerned."

Without giving the Prince time to reply, he ran next to the apartment of the Princels, who was not yet awake. 'Awake her, [cried he, her honour requires it.' ' the noife, her women opened the 'door of the chamber. 'Get up. Madam, [fays the Abbe] fave the "honour of the Prince of Conti-" your own, and that of the family. "The Bishoprick of Valence is va-" cant. I am come to beg his High-" to alk it for me; but rile, Madam, "the moments are precious. Your "uncle will not refuse you, if he " fee that you can get up fo early, and appear before him, in your " morning drefs, in order to per-" form a generous piece of service "to one of your creatures." wished to speak to her husband. I shall take care of that, [returned "he] rife I pray you, and wait on the Cardinal.' She complied.'

Mazarine was not of a temper to give away any thing eafily. He ' haggled with his niece, and pro-' miled her a Bishoprick of less va-'lue, which was also vacant. When ' she returned to her appartments; 'Well!' faid the Abbé, · I have " nearly done your bufiness, [replied the princefs,] but not Va-" lence;' and then she related par-What, [returned the ticulars. Abbé] " you come home fatisfied, and have obtained nothing? The " matter is no longer a concern of " mine, but your own. I declare "that I will have none but Va-" lence; and, as foon as your High-"nefs is dreffed, you will go back, and complete what you have begun.' In fact, a few days after, 'the Abbé Colnac having preached before the Queen, and the whole Court, the Cardinal met him, as 'he went down from the pulpit, and faid, to name you Bishop of " Valance, after your delivering fo

"flowing a Marshal's staff in a breach;—go, thank the King."

'Immediately after his nomination, he waited on the Archbifhop of Paris, and afked him to
to confer on him Prieft's orders,
Willingly, "faid the Prelate.'
Be fo good as make me a Deacon,
too;" be it fo." And a fubdeacon.' Pray, have you undergone the tonfure, yet? [faid
the Archbifhop] you have been
fo feantily ferved with facraments,
that, I fear, we must begin with
baptism."

There are two other anecdotes told of this fingular divine, that may ferve to illustrate his character. The Duke de Candale, who had quarrelled with the Bishop, hap-

house at Valence, in a very large company, said, on pretence of thanking him for the kind reception he met with, but, in reality, with a view to mortify him; 'At least, 'Sir, to shew, that our reconciliation is sincere, permit me, in presence of all these Gentlemen, to

pening to fee him, one day, in his

beg a thousand pardons for the ill offices I have done you with the Prince of Conti. I am forry for them; and entreat your forgiveness.' Make yourfelf easy [re-

"turned the Prelate in a high tone],
"I have repaid them amply, with
the Cardinal."

4 The other anecdote is relative
4 to his journey to St. Jean de Luz,
4 with the Minister. In a party,
5 several of whom made public pro6 selfions of being attached to the
4 Cardinal, the conversation turned
5 upon his Eminence, but not to
6 his praise. One complained of
6 his negligence in rewarding his
6 servants. In the heat of the con6 versation, Cosnac gravely taking
6 up his hat, gloves, and cloak,
6 says, 6 Gentlemen, I wish you
6 good night. I am going to tell
6 the Min ster what we have said:
6 I had rather, both for your sakes
6 and my own, that he should hear

"this from me, than from any of you; who, I well know, would not fail to do him the fervice.' And, he actually went to Maza-rine, and repeated the conversation.

Of the DUKE de MAZARINE.

In the year 1669, the Duke de Mazarine retired from court. St. Simon has thought fit to commemorate this event; and I shall follow his example. Such fingular characters are feldom to be met with. I have feen him' fays our author: he was a big fat man, whose appearance indicated him to be a man of wit; and I have indeed been told by those who lived with him, that he had a great deal of wit, and that of the most agreeable kind. He was a very entertaining companion, exceedingly well informed, a man of tafte, maginificent, brave, affable, and polite; he enjoyed the familiar intimacy · of the King, who always retained an affection for him, and conti-'nued to give him proofs of it, though he deserved to be more than forgotten.

'As fon to Marshal de la Meilleraie, he fucceeded to a very confiderable fortune of his own. And · Cardinal Mazarine chole him for a husband to Hortenfia, the handfomest of his nieces, and for heir of his name and fortune. His father, a man of merit, though an intimate friend of the Cardinal's, long refused to agree to this marriage. He was afraid, he faid, that fuch enormous wealth might crush his family. The son was possessed of eight and twenty millions of livres. to which were added the Governments of Brittany. ' Nantz, Breft, Fort-Lewis, St. Male, Alface, Brefack, Befort, with the great Bailiwick of Haguenau. which alone afforded yearly thirty 'thousand livres, belides the Ga-' vernment of Vincennes, and the office of Grand Master of Artillery. He was made a Lieutenantgeneral

general as early as the year 1654, and might have become, in due time, a Marshal of France. But piety, though so valuable a qualification, and so necessary to communicate value to all others, by warping his mind, spoiled all the talents which he had received from nature, and rendered useless all the advantages conferred on him by fortune.

M. de Mazarine rendered his wife a subject of scandal to the world. He became ridiculous and infufferably troublefome to the King, by teazing him with his pretended visions concerning his Majesty's mistresses. Having retired to one of his estates, he there ·became a prey to pretended faints and devotees, who availed them-· felves of his weakness, and shared his millions. He mutilated the finest statues, and daubed over the best pictures in his palaces, because of their tendency to excite evil thoughts in the beholder. He affigned his domestics their places by lot; in consequence of which, his cook became steward, and another was advanced from a fill humbler place to be his fecretary; and this because lots, in his opinion, indicated the will of God.

'He was pleafed when people brought actions at law against 'him; because in losing a cause, he flost what did not, in justice, belong to him, and when he gained a caufe, his conscience was then satisfied with his right to the difputed property. He was extremely troublesome to the officers on his eftates, by making them enter into minute details of particulars, and impoling abfurd commands. Of thefe, one instance will be enough. 'He forbid the married and the young women to milk cows on his domains. He wished to make his daughters pull out their foreteeth, because nature had given them very fine ones, and he was

fafraid that they might value themfelves too much upon them.

In the latter years of his life, he was constantly travelling about among his feats; and though he had not taken proper care of his wife when alive, he carried her body, which he had caused to be brought over from England, every where about with him after her death. At the last, he had nothing remaining but the Government of Alface, and two or three other trifling places; having diffipated that immense fortune which had excited his father's fears. I faw him, continue St. Simon, when he was made a Knight of the Order, in the year 1688; after which he appeared but about three or four times, and at each for only a very short space, in Paris, and at Court,-where he was always received by the King with an air of friendship and marks of particular respect. M. de Mazarine was about eighty years of age when he died. His death was felt as a lofs by nobody; to fuch a degree had his unhappy turn of 6 mind obscured his excellent qua-'lities."

Of M. la VAUGUION.

La Vauguion was in the habit of vifiting Madame Pelot, the rich widow of a first president of the parliament of Rouen, who gave every evening a supper entertainment, after which her company used to amuse themselves with play. One evening, on his not daring to venture a certain throw, fhe called him, in raillery, a coward. La Vauguion made no reply, staid till he faw all the company leave her, and, when he found himself alone with her, bolted the door, clapped on his hat, pushed her into a corner, and ' pressed her head between his hands, told her, that he knew not what 'hindered him from beating her head into a jelly, for calling him

a coward. The lady was much affrighted, and with many courtefies and excuses sought to pacify him. He, at last, left her, · more dead than alive. He had the affurance to come back, as ufual, after this adventure; and • fhe was fo generous as never to mention it till his death; but took

always great care never to be left

alone with him.'

One of la Vanguion's whims was to get himself put into the Bastille; possibly because he might there be less anxious about the means of subfiftance than at home. He made feveral attempts to accomplish this favourite object; formetimes per-forming acts of imprudence, for which he deferved to be fent there, and fometimes voluntarily offering himself to confinement. Being still refused by the Governor, he, at last, contrived to commit a piece of extravagance, by which he was certain of attaining his purpose. He obliged M. de Courtenai to draw his fword upon him, in the palace of Fontainebleau. The combatants were parted. La Vauguion ran instantly to the King, to offer him his head, as he faid; because, having been infulted by M. de Courtenai, he had drawn his fword against him in the Royal Palace; violating his duty, in defence of his honour. The King told him, that he would enquire into the affair; and he was, in two hours, fent where he wished to be, as well as Courtenai, who, most probably, had not the same predilection for the Bastile. But, they were not long confined.

Of the DUKE of ORLEANS.

The regency of the Duke of Orleans has exposed him to so great a diversity of opinions, that the reader cannot be difpleafed at feeing his portrait, drawn from the life, without disguise or partiality, by the Duke de St. Simon, who was brought up with him, and was always his in-· timate companion. 'This prince was not above the middle stature;

of a full habit, though not fat : his air and carriage were easy and no ble: his countenance open and agreeable; and his complexion florid. He affected to imitate Henry IV. in every thing; in his manner, in his repartees, and even in his faults. Though he had made but indifferent progress in his academical studies, he had naturally a gracefulness in his man; ner, which was distinguishable in his most trifling actions. His mother invented a little fable, which conveys a very just idea of his character.

The lairies [faid fhe] were called to witness his birth. All attended, except one who had long disappeared, and who had been unhappily overlooked. She, however, took it into her head to be prefent among the rest; but before her arrival, they had endowed the child. Affronted at this neglect, the malicious imp, unable to revoke the gift of her fifters, refting on her slender rod; pronounced these words, with a horrid grin; " let him have all these talents; but " I pronounce them useless.' This apologue is the true history of the Duke of Orleans, especially during the life of Lewis XIV. His talents either remained unemployed or were employed to no good

purpose. One accomplishment he pos-' fessed in an eminent degree; that of converting fentibly and eatily on every subject. To hear him talk of politics, government, science, family-hiftory and characters, one would have imagined him a diligent reader; which was by no means the cafe. His memory was, however, fo retentive, that if he but glanced flightly over a book, he could at any time afterwards recollect all the circumstances, facts, and even dates, with furprifing accuracy. Such was the strength of his judgment, that he would have feldom erred, had he always folloved his first idea on every · fubject.

(Continued from page 216.)

THIS volume begins with an account of the different people who inhabit Syria and Palestine, viz, the Arabs, Drusses, and Curdes; these latter, our author demonstrates, are the same as the Assassins; of the Meules, Nazirs, or Nazarenes, Turks, Jews, Latins, Maronites, Greeks, Armenians, Georgians, Ethiopians and Cophts. Of the Arab women he says,

The features of the Arab women are remarkably beautiful when they are young; but they foon become disfigured by certain black (pots like patches, which they make in their faces with a sharp-pointed iron. They mark with the same colour their lips and eye-lasses, by mixing with the paint employed for that purpose a certain substance which they call coliastiri. According to the general custom of the Levant, they dye their nails and the palms of their hands yellow, as I have already observed in the first volume of this work.

Young girls make an opening near one of the nothrils, into which they put a clove: this appears to them to be a peculiar heauty, which they confider as a fign of virginity; though they continue to wear it even after they have had children. There are fome of them who, inftead of a clove, thrust through their nothrils a filver ring, about an inch and a half in diameter; from the bottom of which is suspended a piece of coral, or some small coin.

The women suckle their own children, and never commit them to the care of wetnurses. This custom of sending out children to be nursed, which took its rise in the bosom of polished Europe, is too inconsistent with the views of nature, ever to present itself to the ideas of these simple and rustic people. All the Arab women nurse their own children; all are fond of discharging this first duty of a mother; and none of them will permit another to thare with her in the laborious cares of education, for which she thinks herself sufficiently repaid by the smiles and carettes of innocence. Indefatigable by the

force of maternal tenderness, they may be feen in the longest journeys carrying their children on their shoulders; and, when they have occasion to give them suck, bringing them forward a little, and raising the breast to their mouths.

One difference is remarked between the Arab men and women; which is, that the latter, much less serious when young, become pecyish and melancholy with age : whilst the men acquire with years an opener This difference indeed may and freer air. be remarked among the people of every nation whatever; a defire of pleafing, and of being loved, is the first fentiment that arifes in the mind of a woman; and it grows and increases as the approaches towards maturity: but as love accompanies beauty only, and as beauty disappears with youth, it is not assonishing that a woman should become morose as she advances in Having loft the power of charming, the is no longer followed; and this neglect the is by no means able to support. With men the case is quite different : being formed for accomplishing great things, they feem to abandon their nature when they fuffer themselves to be overcome by love. When the fire of youth engages them in this passion, they fall into a state of languor, by which all their faculties are absorbed: but this impetuosity is cooled by years; they foon return to themfelves; and reason gaining a lasting power over them, permits them to entertain only mild and regular affections, which are displayed in their exterior conduct.

The Arab women wear only a plain robe, after the Turkish manner, and ceasedy ever cover their heads. Their cloaks refemble those of the men: but there are only a sew of them who use drawers, according to the custom of polished people in the east. They ornament their hair with strings of small glass beads of different colours; on their legs and arms they wear bracelets of the same, and have rings made of metal on their singers.

The principal occupation of the Arab women is, to take care of the tents in which they lodge, to provide water, to prepare food, to milk their flocks, and to make butter and cheefe. They likewifs manufacture the cloth necessary for equering their tents.

He then proceeds to give a defeription of the city of St. John of Acre, the monasteries, mosques, &c. In this chapter we have a pretty long P P account of the celebrated Schiek Da- enabled the folitary tenants to increase

Our author next proceeds to describe the journey from Acre to Mount Carmel, and we have a particular account of what is to be found thereon.

On afcending that part of Mount Carmel which projects into the fea like a promontory, you find on the left a garden, furrounded by very weak walls, that conducts to two remarkable grottoes. The first of these grottoes, which is also the largest, and which has been cut into almost a square form by means of the chilfel, is about fix feet in length, twenty-feven in breadth, and twelve in height: from this you pals into the fecond, which appeared to me to be two thirds narrower, and befides very irregular.

These grottoes are held in great venera-tion by the Mahometans, who consider them as the ancient habitation of the prophet Elias. They have converted them into a mosque, under the title of El-Kader; that is to fay, the green, in which fervice is performed by a dervise, or Turkish monk, who with his family lives in a

neighbouring cottage.
This place served formerly as an asylum to some Carmelite monks, who afterwards quitted it, in order to avoid the continual infults of the Arabs. It was indeed too near the high road to afford a peaceable

life to thefe Cenobites.

When you come out from this grotto, into which you are admitted on paying a few pieces of money, you alcend by a very fleep and narrow path, which in some places is cut out in the rock after the manner of steps. Before you reach the summit, you meet with the convent of these folitary monks of whom I have just spoken.

The ftructure of this peaceful retreat excites equal respect and admiration. It is almost indebted for its whole extent to the hand of nature only, which feems to have constructed it in favour of rural and fequestered virtue. The small apartments and cells destined for the use of travellers are fo many convenient grottoes, fuited to the necessities of life. A grotto serves also as a chapel to this facred place, When the traveller stretches his eye across the ocean, where his view is loft amidst the immensity of the watery space which is commanded by the mountain, he thinks himself still more retired from the world. The French merchants of the city of Acre come hither fometimes for the benefit of the air, which is as pure as the innocence of those who have fixed their abode in this charming spot. They have erected a small habitation for their convenience, together with a few additional cells, which have

their number.

CEL

The poli

tigs aga

to call bit we can

The grotto which forms the chapel has two entrances, fashioned by the chistel into the form of doors. One of them looks towards the small square before the monaftery, and the other towards the interior part of it. This chapel, which is very irregular, may be about twenty feet in length, and fix in breadth. It contains two altars, the principal of which is con-fectated to the Virgin, and the fecond to St. Elias.

Two priests, and two Carmelite laics, are almost always here at prayers. The little leifure which they allow themselves is employed in cultivating a small garden

contiguous to the monastery.

These monks live on the charity of the Mahometans, who have often been wit-nesses to their exemplary life. When I saw them bringing their alms, I blessed virtue, the irressible power of which sabdues mankind, and forces even our enemics to relieve our wants.

The route from Acre to Geddin and to the city of Nazareth; from thence to Cana and Tiberias to Tyre, with descriptions of these and several other places, and the route from Rama to Jerusalem follow.

Here, and in the environs, our author has a fine field for his pen. His entrance into Jerufalem will shew the tyrannical disposition of the govern-

ment of that famous city.

Having arrived at the gate of Bethlehem, and having no one to guide me, I refolved to follow the caravan. I entered the city on horseback, which in the last century Europeans were not suffered to do; and, being stopped by a Turkish centinel, paid the usual toll, which is two medins for

each person.

Scarcely had I advanced two steps in the first ftreet, when a Christian of the Latis communion politely accosted me, and asked if I was not a Frankman, which is an appellation bestowed here on all the Europeans. On my returning an answer, he offered to conduct me to the convent of St. Saviour, which is in the possession of the fathers of the Holy Land. This obliging attention from a stranger gave me a very favourable idea of the manners of the people of jerusalem

One of the interpreters in the fervice of the convent appeared very much furprifed to fee me arrive without notice being fent to these good monks by the governor. Ha-ving told him in what manner I had entered, he informed me that I must return without the city; because Europeans who

poled the monastery, and perhaps myself, to some disagreeable exaction. This unlucky accident was very diffreffing to a fatigued traveller; and I filently murmured against the fanaticism of the Mahometans, which delights to torment, by ridiculous customs, those of a different religion from their own. There was, however, no re-medy; and I faid, why blame the super-fitious Musiulmans? They only behave to eatholics in the fame manner as the catholics behave to the Jews. What plaufible reason can the Italians have for compelling these children of the Hebrews to wear yellow caps on their heads, which exposes them to the derision of the popu-lace? We, nevertheless, boast of being enlightened by philosophy.

I was, however, faved the trouble of

my other gate than that of Damascus.

The infraction of this law would have ex-

making a long circuit round the walls. A uniflary belonging to the guard of the convent conducted me to the gate of Damascus, by croffing the city from fouth to north.

The interpreter in the mean time went to ask the governor's permission for me to enter; and having joined me, together with a ciocadar, or officer of the bashaw, I was admitted upon paying a few medias. When we returned to St. Saviour, 1 prefented myfelf to the fuperior, who received me with much politenels. He alked me my name, that of my country, and the object of my voyage; in order that he might infert them in the Pilgrims' Regifter, which is carefully preferved among the archives of the convent. After this, he shewed me the cell deftined for me, which was extremely commodious; and the interpreter introduced me to the other officers of the house.

Some religious ceremonies are here practifed towards travellers; and it would be neither decent nor polite to reject them. They are conducted to vespers, and invited to follow the procession with tapers in their hands. The priefts who officiate wash their feet amidit prayers, and a Te Deum chanted by the choir; after which they are introduced into the hospital, and requested to preserve the tapers in memory of this august pilgrimage.

All Europeans, of whatever religion, are received in the convent, and supplied with every necessary and convenience. their departure they generally leave a fmall fum by way of alms; but this is merely gratuitous, and nothing is ever asked from

The orientals who follow the rites of the Latin church may lodge also with the fathers of the Holy Land; but only for three days: if their affairs require them to refide longer at Jerufalem, they must retire

sene from Jaffa are forbid to pass through to a small house near the convent, to which these monks continue to lend them provisions.

The fuperior showed every possible attention both to me and my friends. We had a feparate table, and were sometimes ferved by the monks themselves, who rea-dily facrificed their moments of leisure to our convenience.

As these reverend fathers seemed very defirous to know what had happened to me in my journey from Rama to Jerulalem, I freely contessed to them, that their brethren in that city had given me very bad advice; and I related the dangers I had encountered in consequence of following it. " A longer perfeverance," added I, "would have obtained the " crown of martyrdom to any one coura-geous enough to feek for it." The anfwer which they returned upon this occasion fully justified the monks of Ra-ma. " An European," said they, who wishes to go to Jerusalem, is more " exposed in the company of a caravan, than if he travelled with two or three " Arabs of known probity. Several of them are ready at all times to escort pilgrims, on receiving a fmall reward, which is paid them by the convent of Jerusalem. They conduct you by un-frequented roads; and besides, they are almost always respected by the banditti whom they meet. For the greater fafety, however, it is prudent in a traveller not to discover his rank, his riches, or his intentions. A plain and even threadbare dress is of advantage to him, as it will prevent all suspicion of his opulence. If these Arabs then happen " to flop him, it is only to examine whether " he be really as poor as he appears. A re-" fufal confirms his difguife; and he can " fullain no injury, because they never in-" fult a traveller through wantonnefs." In short, they concluded that I had made a very bad use of the advice given to me.

The Armenians on this subject follow certain principles which are peculiar to themselves. Instead of dreading to meet these Arabs, they wish for it, and even throw themselves in their way. A few blows of a ftick well applied, in their idea, render a pilgrimage much more meritori-To this fingularity they add another, which is, that on their return they never fpeak of the infults which they have ex-perienced. The closest silence is enjoined them on this head, under the pain of excommunication.

I must here observe, that this article of their belief is the confequence of the policy of their patriarch, who refides at]erufalem, and who has taken care to infpire his people with thefe superstitious ideas; which are serviceable to him. As it is customary for each pilgtim to give him a

present according to pleasure, the greater the number is, the more he receives.

Thus man every where abuses the most facred things, and makes them subservient to his pride and his luxury.

The Abbè thus describes the holy sepulchre.

The fepulchre of Chrift, which is open only on folemn days, is in the Church of the Refurrection. All pilgrims and devotees come hither to celebrate the holy inviteries, under the protection of the governor, who fends a party of foldiers to effort them: and they enter the church in proceeding, and with the found of plaintive music. On this occasion, I think it would be difficult for any person, of whatever religion, not to be inspired with fentiments of reverence and awe, on the fight

of this august temple.

Gloomy, and of an immense fize, it is lighted principally by the lamps which are suspended from its roof. The pilasters are become black by length of years, and no ornaments are to be feen on its walls. The alters and statues of the faints are of coarfe stone, and the chandeliers of wood. Every thing used here for religious service is in the simplest and plainest taste. In a word, this church is poor, but it is what a church dught to be. The Deity requires only from man purity of heart, and an ex-emplary life. Why did Jesus Christ him-felf live in the bosom of indigence? Was it not to teach the world that religion is inseparable from poverty? I will venture to affirm, that it is an insult to Heaven to display too much luxury and magnificence in holy places. It is affimilating things facred to things profane. It is authorizing in the mind of the opulent man that palfion for riches, which makes him turn alide his eyes from misfortune. It is, above all, afflicting the heart of the poor, who cannot resolve to bless misery, before an altar fhining with gold, filver, and jewels.

There are feveral remarks of our author, which are worthy the seader's attention, but our limits will not afford room for inferting them. Among other superstitions of the Greeks of that country, one deserves to be noticed.

There is one superstitious practice, however, used by the schifmatic Greeks, which is so singular, that it cannot fail of giving a momentary entertainment.

This feet, deluded by their priefts, fincerely believe that God annually performs a miracle in order to fend them tacred fire. The manner in which they prepare to re-

ceive it is as follows: A great crowd of femble in the church of the Refurrection, together with people who fell provisions of every kind. A thousand different voices are then heard all at once; and the whole company beginning to run round the cha-pel of the Sepulchre, they press against each other in such a manner, that many of them are thrown down and trod under foot. There are fome who butt at each other like rams, and ftruggle with the greatest violence. A dozen collected together may be feen challenging each other to combat with their fifts. Some traverie the church, riding on each other's fhoulders; others are dragged along the pavement by the feet; feveral refting their bedies on their heads and hands, agitate their legs in the air, or turn round with the velocity of a wheel; while others, uniting together, form pyramids, which tumble down, and often occasion contusions and dangerous wounds to the actors of this strange farce. In the midst of this mad diforder, the arches of the church continually refound with the exclamation, huia, huia; which fignifies, in the Arabic language, Here he is! here he is! it is he himfelf!

These extravagancies are continued for four hours, and are only a prelude to those which are to take place the next day. It is customary for the governor of Jeru-

It is customary for the governor of Jerufalem to be present at this singular scene. A sopha is prepared for him in the gallery set spart for spectators, where he admits, together with his courtiers, all European travellers.

On this occasion, the other oriental Christians, who have separated from the Romin church, may be seen amidst the Greek schissmatics. In their hands they hold wax tapers, painted of different colours, in order to kindle them at the sacred fire which is about to descend.

A strict fearch is in the mean time made throughout every part of the church; and all the lamps are extinguished, to prevent the doubts and suspicions of unbelieving

miscreants.

The Cophts, the Greeks, the Armenians, and the Syrians, walk in procession together, and with no lefs notice and turnuit than is observed during the preceding ceremonies. When this is finished, the bishop of the Greeks, and the patriarch of the Armenians, enter the chapel of the Sepulchre, the doors of which they carefully shut, and place a guard of Turks at them, to keep the people at a distance.

The loud cries, combats, and all the other extravagancies, are then repeated to fuch a degree, that the janiffaries are obliged to check the confusion with their

flicks.

At length the two lateral doors of the chapel are opened together; and the facred

ministers, who present it to the people.

Their hearts are then transported with joy: they halten to light their tapers; hew them to the spectators in the gallery, exclaiming, a miracle! a miracle! and each congratulates the other, on being once more thought worthy of divine faonce more thought worthy of divine favour. They embrace one another with great affection, shed tears of joy, and by every possible demonstration endeavour to express their gratitude towards Heaven. Some carry their folly so far as to burn their slesh by extinguishing a taper against their breast, to sanctify more esticationly, and their souls. A second procedion is afterwards made, by way of returning towards and each retires to his home. thanks; and each retires to his home.

We find therefore that here, as well as elsewhere, the pricits sport with the cre-duity of the people; but I have no oc-casion to explain their motive. It may be readily gueffed that, if they were not well paid, they would not give themselves the trouble to perform a miracle.

TRAVELS OF ANACHARSIS THE YOUNGER IN GREECE, DURING THE MIDDLE OF THE FOURTH CENTURY BEFORE THE CHRIS-TIAN ERA. By the Abbe Barthelemi, Keeper of the Medals in the Cabinet of the King of France, and Member of the Royal Academy of Inscriptions and Belles Lettres. Translated from the French. Seven Volumes 800. and an Eighth in 4to. Containing Maps, Plans, Views, and Coins, illustrative of the Geography and Antiquities of ancient Greece. Robinsons. 1791.

[Continued from page 224.]

WHEN that day arrived, Miltiades drew up his troops at the foot of a mountain, on a spot of ground scattered over with trees, to impede the Perhan cavalry. The Platzans were placed on the left wing; Callimachus commanded the right: Aristides and Themistocles were in the centre of the battle, and Miltiades every where. An interval of eight stadia separated the Grecian army from that of the Perfians.

At the first figual, the Greeks advanced over this space, running. The Persians, aftonished at a mode of attack fo novel to both nations, for a moment remained mo-

the is feen thining in the hands of the two tionless; but to the impetuous fury of the enemy they foon opposed a more sedate and not less formidable fur. After an obitinate conflict of fome hours, victory began to declare herfelf in the two wings of the Grecian army. The right dispersed the enemy in the plain; while the left drove them back on a morafs that had the appearance of a meadow, in which they fluck fast, and were lost. Both these bodies of troops now flew to the fuccour of Aristides and Themistocles, ready to give way before the flower of the Persan troops, placed by Datis in the centre of his battle. From this moment, the rout became general. The Persians, repulsed on all fides, found their only asylum in the fleet, which had approached the fhore. The conquerors purfued them with fire and fword, and took, burnt, or funk, the greater part of their velicls : the rest escaped by dint of rowing.

> The fucceeding events of this age are rapidly hurried over, yet told in so lively and interesting a manner, that it is impossible to give any adequate idea of the spirit of the work without transcribing, which we fear we have already done too freely. Our readers will, however, judge, by what we have offered, of the merits of the whole, which no where is inferior, but often rifes much higher with the importance of the subject. If we rather selected the battle of Marathon than that of Thermopyla, it was because it was shorter, and less connected with other events.

> The age of Pericles closes the glory of Athens. Within it is comprehended Alcibiades, and all the interesting events that attended that extraordinary character, as well as the general temper of the Athenians, ata period when riches flowed in upon them by every channel. The unfortunate expedition to Syracule, so often compared to the American war of our own times, and our own country. is told with more brevity than we could have wished, confidering the important lesson it affords to all nations in the hour of their infolence. The volume closes with an account of the flate of learning in those times, which are supposed to be immediately antecedent to the period

when Anacharfis commences his tra-

In the second volume our author begins his travels. His introduction is in the simple style of the ancients.

Anacharsis, a native of Scythia, the son of Toxaris, is the author of this work, which he addresses to his friends. He begins by stating to them the motives that induced him to travel.

You know that I am descended from the sage Anachars, so celebrated among the Greeks, and so unworthily treated by the Seythians. The history of his life and death inspired me, from my earliest childhood, with estern for the nation which had honoured, and with distaste for that which knew not how to appreciate, his

This difgust was still more increased by the arrival of a Greek stave, whom I purchased. He was of one of the principal families of Thebes in Beotia. About thirty-six years before, he had followed the younger Cyrus in the expedition undertaken by that prince against his brother Artaxerxes, king of Persa. Being taken prisoner in one of those engagements to which the Greeks were compelled in their retreat, he frequently changed masters, and wore the chains of servitude in different nations, till chance brought him to the country in which I lived

the country in which I lived.

The more I became acquainted with him, the more fensible was I of the afeendency of an enlightened over an un-inftructed people. Timagenes, for that was the Theban's name, at once delighted and humbled me by the charms of his conversation, and the superiority of his knowledge: the history of the Greeks, their manners, governments, sciences, arts, fettivals, and spectacles, were the inexhaustiple topicks of our conversation. I interrogated him, and I listened to his seplies with transport. I was then just entering my eighteenth year, and my ima-gination added the liveliest colours to the richness of his descriptions. I had hither-to feen nothing but tents, slocks, and de-ferts. From this time, incapable of enduring the wandering life I till then led, and the profound ignorance to which I was condemned, I resolved to abandon a climate where Nature scarcely provided for the necessities of man, and a nation whose only virtue feemed to me to confift in its ignorance of vice.

It is impossible not to feel interested in every part of this valuable narrative; it is equally impossible not to

reap inftruction, or improve the heart. Every enquiry is directed with judgment and fagacity, every remark evinces a superior mind, and every refearch tends to objects that may increase the happiness of mankind. With Timagenes, to whom he gave liberty, and whom he made the companion of his travels, he failed down the Tauric Cherfonefus, now called the Crimea, of which a most interesting account is introduced. as well as of the Pontus Euxinus An opportunity, by convering with fome of the paffengers on board the vessel, occurs of describing the general state of Greece previous to the date of Anacharfis's travels. The Thracian Bosphorus and Byzanium, now Constantinople, are described with the accuracy of a geographer, a philosopher, and a merchant. Lefbos introduces an account of Sappho and Alcaus, collected with wonderful industry, and described with equal exactness and critical acumen, The account of Eubœa is made interefting, though, perhaps, in a few instances, it is more precise than such of our readers as have not a true telish for every minutia of classic terntory can relish. From hence our hero arrives at Thebes, the country of Timagenes, and has the happiness of being introduced to Epaminondas. Athens follows, and every thing that can engage the attention of a traveller, a scholar, a philosopher, a politician; in fhort, every thing that can be heard or feen at Athens, is made interesting; and persons of the least classical curiosity are detained, in fpite of themselves, with all the eagernels of enquiry.

The academy is our author's first object, where he enjoys the conversation and lectures of Plato, and is entertained with the peculiarities of Diogenes. The following is part of the description of Plato.

He now felt an ardent defire to make himfelf useful to mankind. The Peloponnesian war had destroyed every prisciple of virtue, and corrupted the public manners. The glory of restoring them excited his ambition. Agitated night and day by this fublime idea, he waited with impatience for the moment, when, inveled with the functions of magifracy, he flould have it in his power to diplay his zeal and talents; but the rude flocks de republic had met with in the latter years of the war, those frequent revolutions which in so short a time exhibited tyrany under forms daily more terrific, the death of Socrates, his master and his friend, and the reflections that such a series of events gave rise to in his mind, son convinced him that all governments habour under incurable disorders; that the stairs of mortals, if we may so speak, are desperate; and that they will never know happiness till philosophy shall take them under her guidance. Abandoning therefore his project, he resolved to increase his stock of knowledge, and to dedicate his acquirements to the instruction of his country. With this view, he travelled to Megara, into Italy, Cyrenaic, and Egypt, and where-ever the human mind had made any progress in improvement.

Thus we see, even as early as Plato, every ferious and good man regretted, that philosophy should not ave been applied to the science of junisprudence and legislation. It frems, indeed, to have been referred for the present age to deride what all antiquity has reverenced, and reverence the institutions of barbarians and favages, which all the good and wife men of antiquity have regretted hould ever have existed. A melancholy instance of the weakness and wickedness of one part of our race, who are only afraid of discussion, when truth is on the eve, not only of being discovered, but adopted.

The scholar will, perhaps, be most of all astonished at seeing, by the authorities produced, how much he has overlooked, even in his careful perusal of the classics. No instance more remarkably illustrates this than the account of the private life of the

Athenians.

At the crowing of the cock, the inhabitants of the country enter the city with their provisions, finging ancient ballads. At the same hour, the shops open with no little noise, and all the Athenians are in motion. Some resume the labours of their profession; others disperse themfelves, in confiderable numbers, among the different tribunals, to exercise the functions of judges.

Among the people, as well as in the army, it is customary to make two meals a day; but persons of a certain rank content themselves with one, which some eat at noon; but the greater number a little before the setting of the sun. In the afternoon, they take a sew moments sleep, or play with little pieces of bone, or at dice, and other games of commerce.

dice, and other games of commerce.

In the first of these games, they make use of four small pieces of bone, having one of these four numbers, 1, 3, 4, and 6, on each of their sides. From their different combinations result thirty-sive throws, to which they have given the names of gods, princes, heroes, &cc. Some are losing, and others winning throws. The most favourable of all is that they call Venus, which is when the four bones turn up the four different numbers.

In the game of dice, they likewife diftinguish lucky and unlucky throws; but frequently without attending to this diftinction, it is only necessary to cast a higher number than the adversary. The pairroyal of fix is the most fortunate throw. Only three dice are employed at this game. They shake them in a dice box; and, to preyent cheating, throw them into a hollow cylinder, through which they pass, and roll upon the chequerboard. Sometimes, instead of three dice, they make use of three of the little bones above mentioned.

The preceding games are games of pure chance, but the following entirely depends on judgment. On a table, on which are traced lines or pyramidal points, they range on each fide pieces, or men, of different colours. The skill of this game confishs in suffaining one piece by the other, in taking those of the adversary, when he leaves them unguarded; or in blocking him up, so as to prevent him from advancing: but he is permitted to play again when he has made a wrong move.

Sometimes the latter game is played with dice, the player regulating the moves of his men, or pieces, by the number he throws. In this case, it is his business to know what throws will prove fatal or advantageous to him, and to profit by the favours of fortune, or, by judgment, correct her caprices. This, as well as the preceding game, requires a number of combinations, and, to excel at it, should be practifed from early youth. Some perfons acquire such a degree of skill, that their names become celebrated, and that no person will venture to play against them.

At different times of the day, and ef-

pecially in the morning, before noon, and in the evening, before supper, the compa-ny repair to the banks of the lliffus and the environs of the city, to enjoy the ex-treme pureness of the air, and the de-lightful prospects that present themselves on every fide; but the usual place of meeting is the forum, the most frequented part of the whole city. As it is there that the general affembly is often held, and the palace of the fenate, and the tri-bunal of the chief archon, are fituated, almost every one is attracted thither by his own private bufinefs, or the affairs of the state. Many persons resort thither for amusement, and others in search of employment. At certain hours, the fquare, cleared from all the incumbrances of the market, leaves an open field for those who wish to entertain themselves with observations on the crowd, or make a display of

their own persons.

Around the square, are the shops of persumers, goldsmiths, barbers, &c. open to every person, in which the interests of the flate, anecdotes of private families, and the vices or ridiculous conduct of individuals, are warmly and clamorously From amidft thefe groups, discussed. which, by a confused motion, are perpe-tually separating and re-uniting, iffue a thousand ingenious or satirical pleasantries against those who mix with the company in a flovenly habit, or prefume to dilplay an offensive offentation; for this people, paffionately addicted to raillery, are ex-pert at a kind of facetiousness the more formidable, as their malignity is dexteroully concealed under it. Sometimes we meet with a select company, and instruc-tive conversation, in the different porticos dispersed through the city. Such little parties cannot but be numerous among the Their infatiable thirft for Athenians. news, arifing from the natural activity of their minds, and the idleness of their lives, forces them to seek the society of each other.

This tafte, which is fo predominant as to draw on them the name of loiterers or loungers, in time of war becomes a kind of madness. Then it is that in public, and in private, their conversations turn on military expeditions, and that their first question on meeting is, What news? Then are feen on every fide those swarms of newimongers, tracing out upon the ground, or on a wall, the map of the country in which the army then is, loudly proclaiming its successes, and whispering its defeats; collecting and exaggerating rumours which either throw the city into the most immoderate joy, or plunge it into the very depth of despair.

The Athenians employ their hours of peace in amufements of a more pleafing nature. As the greater part of them cul-

tivate their own estates, they mount their horfes in the morning, and, after direction the labours of their flaves, return in the

evening to the city.

Their time is fometimes filled up by hunting, and the exercices of the gyma-fium. Befides the public baths, whither the people flock in crowds, and which ferve the poor as an afylum against the inclemencies of winter, private persons have baths in their houses, and the use of them has become so indispensable, that they are introduced even on board their vessels, They frequently take a bathe after their walk, and almost always previous to a nepast. They come out of the bath perfumed with effences; and these odour mingle with those they carefully sprinkle over their garments, which are diffin-guished by different names, according to the difference of their form and colour

In general, they are contented with throwing over a tunic that descends to the midleg, a mantle which almost entirely covers them. None but the country people, or persons without education, tack up the different parts of their dress above

the knee.

the knee.

Many persons go bares oted; others, whether in the city, or on a journey, say, sometimes even at processions, cover their heads with a large slapped hat.

In the form and disposition of the several parts of dress, the men are expected to study decency, the women to unite elegance with take. The latter wear, is, a white tunic, which is saftened with batwhite tunic, which is faftened with bat-tons over the floulders, clofely bound un-der the bosom with a broad fash, and de-feends in waving folds down to the heels: adly, a shorter robe, confined round the waist by a broad ribbon, and, like the tu-nic, bordered at the bostom by siripes, or edgings, of different colours; fometimes it has sleeves covering only part of the arm; gdly, a robe, which is sometimes worn ga-thered up like a scarf, and at others suffered to unfold itself over the body, the contours and proportions of which it is very well adapted to display; for this they often substitute a light mantlet. When they go out, they wear a veil over their heads.

HISTORICAL REVIEW OF THE AD. MINISTRATION OF M. NECKER. Written by himself. Translated from the French. 8vo.

The unfortunate victim of repeated infances of injustice, of which the annals of hillory can furnish few examples, I felt all the weight of the most bitter recollections, shout at the same time entertaining a rih to diffeminate my painful fenfations by means of the preis. After fo long a eries of public actions, words I conceived were unnecessary; and, comparing someince my conduct with the ungrateful in-difference of the National Assembly, I found in perfect filence a repose that was pleasing to the pride of my heart. Public opinion, in short, I scarcely know why, is an longer in my estimation what it was. The religious respect I entertained for it diminished, when I saw it subservient to the artifices of the defigning; and when I law it tremble before the very men whom it would formerly have summoned to its bar, to expose to shame, and to brand with its reprobation.

I am urged however by my friends to urue a different line of conduct; but I till doubt whether the advice be prudent. They wish me to recal the attention of the public to my administration; they will be to revive the remembrance of it; and they forget that in this day of trouble and anxiety ellindividual interests are set aside for those of the nation.

This reason, we think, should have guided him, and he might have been affured, that in the calm moments of recollection, his services to France would never have been forgotten,

However we may wish, for Mr. Necker's fake, that he had configned his work to oblivion, or had at least suspended it until his mind had been calmer, yet we cannot help rejoicing in the affistance it will afford the future historian of the times.

Mr. Necker tells us, that his first essay in public affairs, was an attempt to invigorate the declining state of the East-India Company; that in 1775 he discussed the principles ap-

attacks of fuch an abandoned cha- plicable to the legislation and comher as M. Calonne, as from the merce of corn; this he tells us was fire shafts of the Gallery of Por- the first successful attack upon that gain; but we are forry to say he has philosophic sway, whose power has discovered in this publication his been experienced in so many different.

spinit the goadings of disappointed The dreadful state of the sinances ambition. His motives for the preto entrust him with the direction of the treasury. It had fallen to decay under the administration of men bred to the law, and it was proposed to try the expedient of what knowledge obtained in another way would do.

Mr. N. then proceeds to detail the principles on which he acted while in administration, and the advantages he rendered the country; for proof of which he refers to the Compte Rendu, and his Treatife on the Finances.

In doing this, Mr. Necker contrafts his conduct with that of the National Affembly, in a manner not very decent to that body; he laid, he fays, the first stone for the esta-blishment of the Provincial Assemblies, and made public the state of the finances, certainly two very important points, and which do him great credit; but how he affifted in abolishing the right of mortmain, he has not told us.

After his first retreat, he devoted his leifure to the composition of his work on finance; in this our author justly observes, he has inculcated the inseparable union policy ought to hold. with moral principle; and he also composed his work on the importance of religious opinions. Here he breaks out into a lamentation we think highly unworthy of Mr. Necker, and which shews how much he feels the injury he conceives he has received.

Alas! in my present situation why have I not this book still to write! They were tranquil days which I paffed in raising myfelf by meditation to the idea of a Supreme Being; and I have now more need than ever of placing myself in this happy fanc-tuary. We there see the injustice of men from fo great an eminence, that we can probation of their conduct, we can fill love them in the midft of the perfecutions of which they have rendered us the victims. The idea of a Supreme Being, that every fort of loan, and of fixing and rem. idea ever falutary, is applicable to every occurrence of human life; and while by its greatness it fills the compass of the world, more subtle than light, it pierces to the bottom of the foul, to fill it with the confolations of which human nature is susceptible.

I have need of these reflections, I have need at this moment of repose, before I farther present myself to the eyes and examination of men, before I pursue a discussion the necessity of which is painful to

my heart.

His next administration commenced in 1788, in which he found still greater difficulties to struggle with. His actions during this administration were certainly and praife-worthy, but why he should exclaim " All' these cares, all these folicitudes have been forgotten as a dream," we are at a loss to know.

In short, were we to relate all the expressions of vexatious disappointment, and in some cases the unmanly mounings in this work, we should

tire our readers.

But to return to the historical part. In 1788 the calling of the States-General was determined, and the Commons succeeded in obtaining the object of their wishes, a representation equal to the two other orders This claim Mr. Necker, combined. much to his honour, supported.

In defending this measure, Mr. N. blames the nobles for rejecting the accommodation fuggested by king's ministers, which, he fays, might in time have reconciled the jarring interests of different parties; in which we cannot help thinking that Mr. N. shews the greatest degree of political blindness; for we are well affured that jarring parties in a flare, must infallibly bring on tyranny, or a revolution.

Mr. N. feems also to have misconceived the conduct and motives of the

National Affembly.

It is a truth which cannot be disouted. that a nation is free, and becomes the guardian of its own happiness, when it acquires the power, or enjoys the right, of granting or resusing taxes, of approving or opposing

lating the whole expenditure ; when every reform and melioration are subject to its free controul; when all pecuniary immunities are already abjured, all acts of arbitray authority proferibed, and the periodical meeting of the National Affemblies made an effential part of the king's engagements, But all these salutary innovations were fecured before the States General entered on their deliberations, or even began to al-femble. The king made no feeret of his intentions; he wished to render the facifices he had made immutable, and was defirous of guarding from every species of revolution the political advantages the nation was about to enjoy; and he would have confented to any just measure likely to advance a plan conceived in mature wildom, and the full and complete execution of which opened before him a profped of happiness, and a fure way of rendering his name precious to future generations.

It is then by a fort of usurpation of the

gratitude of the people, that the National Affembly always speaks of happiness and liberty as conquests which it has obtained. The National Assembly has doubtes wished and effected more than had entered into the views of his majefty: but the first foundations of the constitution, those which form the key-stone of the arch, were hid by the king; to his beneficence are they to be afcribed, and it is to be doubted whether the various fources of power grafped by the National Affembly are favourable to public

happiness and true liberty.

The National Affembly also assumes, in my opinion, too much, when it ascribute itself alone all the merit of the various individual benefits which are included in the circle of its proceedings. A confiderable portion of gratitude is certainly due to it: but it is apparent, at the same time, thu the reform of the enormous abufes aga which public opinion had declared itself, cannot be regarded as the appropriated work of certain individuals; but is rather the inevitable effect of that mais of knowledge existing in twelve hundred perform felected by the nation, in the midst of m age fo eminently enlightened. It is cuft to calculate what fuch a combination mile produce, but the first merit is due to the having encouraged and stimulated it. Yes, it is there the merit lies, and a merit it is that is unrivalled and unexampled. To the virtuous monarch it belongs, who, by calling around him in great numbers the representatives of the nation, forgot his perfeat intereffs, to think only how he could afcertain with certainty the wish of the whole, and confolidate the happiness to the state of the whole, and confolidate the happiness to the state of the was anyting it should enjoy. was anxions it should enjoy.

Meanwhile, in estimating the work of the National Assembly, and enumerating

in claims to public gratitude, men conmd what belongs to the king with what belongs to the affembly, and form from the whole a trophy in honour of the latter, fough would in my opinion remain with the Affembly, by giving to Cafar the things that are Cæfar's.

Mr. N. forgets that people who wish to be free, must affert and hold that freedom as from themselves, and not

ma boon from a prince.

His speech in the States General sext follows; the cold reception a part of this met with feems to have been his first mortification. However, the affistance he received from Mr. Montmorin, of which he fpeaks highly, greatly cheered him. On the great eftion between the three orders of the State. he inferts the opinion he gave, which with his remarks on it are as follows.

The king however not wishing to preferve any greater portion of his right than was necessary for the removal of difficule, I made to the committee of the three orders a proposal of so unexceptionable a source that I shall transcribe it word for word, without omitting the few fentences of recommendation with which it was accompanied.

" The three orders might, by an act of free and liberal confidence, mutually refer the verification of the powers, in cases where any difficulty arofe, and communicate to each other the documents and evidence for the purpole of a rapid and

general review.

" They may farther agree:

" That any disputes which might arise hould be referred to the examination of a committee selected from the three orders.

"That this committee should make a

report of their opinion.
" That this report should be laid before the chambers respectively ;

That if it were approved, it should be confidered as final: " That if, on the contrary, the decision of the orders were in opposition to it, and

there was no probability of conciliating the dispute, the business should be referred to the king, whose judgment thould be

" They might farther agree, that this mode of determining the verification of the powers, should have nothing to do with the grand question of deliberating in common, or in separate orders; they might add that the proceeding adopted

upon the prefent occasion should be refumed in the course of the fession, to confider if any better mode can be devised as to the future; and they might add any other precautions that might be thought expedient: but let this or fome other means of conciliation be adopted, and let not the king be the only person in the naestablishment of peace and unanimity. What true citizen can refuse to comply with the wishes of the best of kings, who fees with the deepest concern the many calamities that may arise from distentions in the first step of a career to which the welfare of the state calls you, in which the nation is anxious to fee you proceed, and where the greatest dangers encompais you? Alas! could you even accomplish this welfare by variance of opinion and animolities of heart, it would be bought too dear. The king then invites you to take into confideration his proposal, and he earnestly intreats you to give him the fatisfaction that will refult from your accepting it."

It is difficult to conceive how fo rational a proposition, made in so becoming a manner, in which the king no farther interfered than was necessary to concellate the minds of the reprefentatives, could be rejected. That the deputies of the commons, confeious of the power with which public opinion had invested them, should fee with pleafure the refufal of the Noblesse and clergy, is not to be wondered at; but that the two higher orders should not have felt the propriety of fetting an example of deference to the conciliatory views of the king, a deference that, at this critical period, would have been followed by that of the commons, is a degree of impolicy that cannot well be explained. How many reasons had they for pursuing a different conduct! It was a mere punctilio that pre-vented them; but this punctilio was not lefs the cause of the breaking up of the conferences, a circumstance to which a confiderable ferics of events may be im-

puted.

An assembly of men met together for public affairs, offers to the mind of the spectator a variety of reflections. I believe that a fet of negociators, brought together for the purpose of adjusting a controverfy, can fearcely be expected to agree when they are merely the representatives of reprefentatives; and fuch was the committee appointed by the national deputies. There is need fomewhere of a centre of communication to harmonize the feelings; there is need, either in the elector or the elected, of fome general medium for reconciling distant interests, vague ideas, and prospects of the future, fince in the war of the paf , fions it is only by future and not by in

mentary interests, that they can be recon-

The fuccess of the Tiers Etat or Commons in their claim, induced Mr. N. to advise concessions on the part of the king and the nobles, but not succeeding, he determined to refign, which he foon after did. He received a letter from the king to withdraw himfelf without noise; this order came at three o'clock, and at half past five he While on his journey, he received the well known letter of recal from the king and national affembly, on which he immediately returned: this return, which he declares was from an affection to France only, has by his enemies been ascribed to perfonal confiderations. The compliments paid him by the national affembly, and the pardon granted to all persons at his suggestion and request, do him infinite honour.

The repeal of this pardon was brought about by the intrigues of the Democrates, with whom Mr. Neckar feems to be greatly at enmity. The National Affembly are also in general the object of his censures; and heenters into a detail of the finances, to shew in what part he thinks their conduct

wrong.

His conduct respecting the vero must be laid before the reader at large.

Let us examine how I acted in that most difmal of all nights, when the few torches which enlightened it were carefully extinguished, from the most despicable of all parsimonious motives, that of ingra-

titude.

One of the parties into which France is at prefent divided will perhaps be surprised that I should rank my conduct, at the epocha of the gravest of all discussions, that of the veto, among the number of services rendered to the state. Passion must sit in judgement upon all things; and prudence must not shew its face. Let the motives that guided my conduct once more be explained.

The absolute veto granted to the king, was supposed or represented to be an impediment to every falutary reform of which the nation was desirous; or at least a political step towards making the establishment of public liberty, and the happiness of France,

dependent on the will of the minifiry, Thus considered, it may well be imagined how important the question must appear; and the agitation in Paris, and throughout a great part of the kingdom, was extreme. It was therefore infinitely probable that, had the affembly been reduced to the neceffity of deliberating whether the abfolute veto of the king should be rejected or to ceived, guided by its own feelings or harried away by public clamour, it would have decided that the royal fanction was not ac-ceffary to give validity to laws decreed by the representatives of the nation. But let us suppose a small majority on the contrary fide; fuch a feeblo fuperiority of votes would not have given permanency to decree of this nature; and the gene disposition would have been felt, in the most violent manner, on the first opportunity.

The fegeneral circumstances, as generally known, and the particular information which I collected, made me fonsible of the necessity there was of a point of conciliation proper to calm this dangerous effervescence, without depriving the king of the means of affording such resistance to the decrea of the National assembly, as the good of

the flate might require.

It is evident that this last purpose we entirely effected, by reserving to his mijely the power of resulting his sanction to the screes of the National Assembly, notwish standing the demands of a first legislature, and the perseverance of a second, though he were obliged to yield to the sense of the nation, in case a third legislature adhered to the sense mation, in case a third legislature adhered to the sense of the two preceding. Such constancy and perseverance of sense in the part of the deputies of the nation, can leave no doubt relative to public opinion. And how can it then be imagined that a prudent prince would oppose invincible resistance to a union of sense imments so general and so long supported? If from singularity of character such should be his defire, it were to be wished, for the good of the state, that the constitution should ast acknowledge his right.

However, as I carefully shewed in my seport to the king on that subject, which report was communicated to the National assembly and printed, there was this gnad difference between an absolute vets and that of which I furnished the idea; that the latter was of real service, whereas the former would have been reduced to a simple honorary prerogative. It never could be supposed that the king could perpetually impede a law enacted for the public good, and pertinaciously insisted upon by the representatives of the nation: and the dread of awakening irritation, by once resuling the royal sanction, and of exciting

enverfal discontent, would constantly have deterted ministers from formally exerting the prerogative on any occasion. Great was have been their courage thus to expose their own fafety; and such courage would not frequently have been deficient in syndence.

The fame cannot be faid of the fuspending tos, as proposed by me. This kind of opposition, contained within just limity, would caim first suspections, prevent the imagination from running astray, and give the monarch all necessary time to obtain the support of the public. This is all which the chief of a kingdom can want, under such circumstances. He may be ampared to a general in a camp; too seeble to sustain an obstinate attack, but song enough to take time to examine whether auxiliaries can or cannot be brought to his aid.

The king in the English constitution has aright to refuse his consent to bills passed both houses of parliament, as long as he all please. But it is generally acknowledged that, were he to exert his right on asy important occasion, he would be bliged to dissolve the parliament. And, hould a new parliament adopt the principles of the preceding one, the king would he under the absolute necessity of complying; not conftitutionally, but in order to perent the refusal of fubfidies, or some other more ferious diffurbance. This right efrejeding bills is therefore in reality reduced to a kind of royal pomp. His oppolition can only be suspensive and tempo mry; and, for the very reason that its duthe monarch is necessarily more circum fpect in the use of his prerogative. England cites but one example of its having been exerted.

No inconvenience can refult from its being a moral impossibility that the king ould reject bills presented by parliament; because, parliament being composed of two houses, the deliberations of which are diffinct and feparate, the rifk of an inconsderate veto, on his part, is a danger which does not exist. And one of these houses, that of the lords, watches in a particular manner over the indifereet attempts which are made on the royal prerogative. But in the French constitution, where there is only one house of parliament, it would be very unfortunate for the state if the royal position to all the decrees of the National Allembly, thus constituted, were rendered wholly ineffectual. The only mode of preventing fuch an inconvenience, was that of fixing the duration of his opposition; that, being considered by the nation as temporary, government might exert it without exciting any dangerous commotion.

I was certain, long before this contest

concerning the veto, that the establishment of two houses, especially two houses composed of elements so discordant, would never take place. And it was this forestight which induced me to be the more active in preserving to the king a right of opposition, circumscribed by reasonable limits; and which might not be merely honorary, without the power of application.

Thefe calculations of prudence have been the fport of accident; but the expedients employed to render them fo are a new proof in their favour. I will freak the truth; filence would be cowardice. Those who exercise a power, sometimes fecretly fometimes openly, over the Na-tional Affembly, took umbrage at the effeet produced on the public by the real fonable and guarded observations which the council of the king indulged themselves in, relative to some of the resolutions of the Affembly. They forefaw that, by the aid of these observations, government might without danger have recourfe to that right of opposition which the constitution had fo lately granted the king; and as this did not accord with their absolute will, they felt how necessary it was to clothe the use of the suspensive veto in terror, in order to render it ineffectual. They regretted that fuch a right had been admitted; and. were we defirous of fearthing into certain mysteries, this reflection would easily be brought to coincide with the project formed to oblige the king to fix his abode at Paris. It was immediately after his arrival at the Thuilleries that he was required to fanction, without referve, all the refolutions of the tempessuous night of the 4th of August; that they fixed the term of eight days to grant or refuse his fanction to all their decrees without diffinction; that they prescribed their laconic formulary; and that they indirectly gave the ministers to understand how useless every kind of previous objection would be. By thus depriving the king of every means of aid from the public opinion, and by giving at the same time free course to popular effervescence, all opposition on his part would have been rendered dangerous : and . then, far from regretting the imaginary right of an indefinite veto, far from reflecting on the too fort duration of the right of opposition which was to extend to the calling of a third affembly, ambition would frequently have limited itself to a suspenfion of a fortnight, or of a month, a delay fufficient to fuffer first emotions to cool, when certain decrees thould have been presented for the royal fanction.

The National Affembly never certainly intended to ad contrary to the prevailing opinion, fince in that opinion confided aid its power. The king can at preferr lefs

effectually struggle with popular emotion. But public opinion presents a different aspect according to the time given it for confideration, and according to the lights by which it is guided. Thus a suspensive neto, as far as the third affembly, satisfies every precaution which reason can advise, or the good of the state require.

I therefore again repeat, that with two houses of parliament, as in England, the indefinite veto would perhaps be the best; for when the powers are intended to be dormant, that which has the most dazzling appearance is to be preferved. But, where there is but one house of parliament, the suspensive veto, as proposed by me and adopted by the assembly, is, in the opinion of many men of fense, one of the happiest thoughts in the whole con-

Were we to give imagination the reins, we certainly might suppose cases, or in-vent an hypothesis, in which, in despite of the obtainacy of three successive afternblies, and the guarantee of the national wish, the law which the monarch might be required to fanction might be contra-dictory to his opinion. But such suppofitions are absolutely chimerical. Bende, it is sufficient that political laws include within themselves all which is probable, all which is morally possible. Peculiar occasions demand peculiar modes of ac-

A NARRATIVE OF THE BUILD-ING, AND A DESCRIPTION OF THE CONSTRUCTION OF THE EDYSTONE LIGHTHOUSE WITH STONE: To which is added an Appendix, giving some Account of the Lighthouse on Spurn Point, built upon a Sand. By John Smeaton, Civil Engineer, F. R. S. Folio, pp. 212, 23 Plates, 3 Guineas. Nicol.

THE Edyftone Lighthouse has long been an object of attention to the curious; and the public are certainly under obligations to Mr. Smeaton for this truly valuable work, valuable in many points of view: it gratifies the curious, assists the man of science, and raifes high the national character for ingenuity.

The lighthouse now standing was finished in 1759: the public then fhewed a great defire to be acquaint-

ed with the method of its conftruction; and the brethren of the Trinityhouse requesting that it might be made public, Mr. Smeaton determined to undertake it, but was long prevented by other occupations. How. ever he has at length found leifure

to complete it.

The Edystone rock is fituated twelve miles and a half from the Ramhead, which is the nearest point of land, and in 30 fathom water, is exposed to the sea's rolling in from the Bay of Biscay and the Atlantic Ocean; and from the particular form and position of the rocks, the fea fwells over them with dreadful violence, not only in a storm, but when it is fmooth, and even then breaks over them in a furprifing manner, arifing from what the seamen call the ground swell.

The rock is a species of hard flate, like the moor-stone of Cornwall, only formed into lanting.

The many fatal accidents which had happened to ships, particularly homeward bound, rendered a lighthouse thereon absolutely necessary. The difficulties attending such an undertaking appeared great, if not insuperable; however in 1696, Mr. Winstanly, of Littlebury, boldly undertook it, and was furnished with the necessary powers to execute it. Winstanly had diftinguished himself in a certain branch of the mechanics which has a tendency only to raise wonder and surprize; from him, therefore, we must not expect a defign founded on the rules of science. An abridgement of his own narrative will be entertain-

" This lighthouse was begun in the year 1696, and was more than four years in building; not on account of the magnitude of the work, but from the difficulty and danger in getting forwards and backwards to the place; nothing being or could be left there, for the first two years, but what was most thoroughly affixed to the rock: and though little could be at-

tempted

tempted but in the fummer feafon, et the weather at times would prove to bad, that for ten or fourteen days together the fea would be fo raging shout these rocks, that though the weather should seem, and be, almost calm in other places, yet here it would mount, and fly more than 200 feet, and has been found fince there was lodgment in the places; and therefore all our work was constantly buried at those times, and exposed to the mercy of the fea.

"The first summer was spent in making twelve holes in the rock, and faltening twelve great irons to hold the work that was to be done afterwards; the rock being fo hard, and the time fo short to stay, by reason of the tide or weather, the diffance from the shore, and the many journeys loft in which there could be

no landing at all.

"The next fummer was fpent in making a folid body, or round pillar, twelve feet high and fourteen feet in diameter; for then we had more time to work, with a little better landing, having fome fmall shelter,

and fomething to hold by.

"The third year the pillar was made good at the foundation from the rock to fixteen feet diameter, and all the work raifed, which, to the vane, was eighty feet. Being all finished, with the lanthorn, and all the rooms that were in it, we ventured to lodge there, foon after Midfummer, for the greater dispatch of the work. But the first night the weather became bad, and fo continued, that it was eleven days before any boat could come near us; and not being acquainted with the height of the sea's rising, we were almost all the time drowned with wet, and our provisions in as bad condition, though we worked night and day as much as possible, to make theiter for ourselves.

"The fourth year, finding in the winter the effects which the fea had upon the house, and burying the lanthorn at times, although fixty

compassed the building with a new work of four feet thick, from the foundation, making all folid for twenty feet, and taking down the upper part, and enlarging the rest in proportion. I raised it forty feet higher than it was at first, and made it as it now appears; and yet the fea in time of storms flies upwards of ene bundred feet above the wane, and covers half the fide of the house and lanthorn, as if it were under water."

In 1703, Mr. Winftanly vifited this building to repair it; and in the dreadful storm in November that year, the whole building, together with Mr. Winstanly and his workmen, were fwept away. However, the utility of the structure required it should be immediately replaced; but it was not fer about fo foon as it ought to have been, for the act to enable the Trinity-house to rebuild it did not pass until 1706. By virtue of this act, the Trinity-house granted a lease to Captain Lovet for ninety-nine years. Upon this foundation Captain Lovet engaged Mr. John Rudyard to be his engineer, and the event has shewn he made a proper choice; though it does not appear that Mr. Rudyard was bred to any mechanical business or scientific profession, being at that time a filk-mercer on Ludgate-hill.

It is not very material now, in what way this gentleman became qualified for the execution; it is fufficient he directed the performance of the work in a masterly manner. He faw the errors of the former building, and avoided them. Instead of a polygon, he choic a circle for the outline, and carried up the elevation in that form. He seems to have adopted ideas the very reverse of his predecessor; for all the unwieldy ornaments at top, the open galleries, the projecting cranes, and other contrivances, more for ornament and pleasure than use, Mr. Rudyard laid totally afide: he faw that, how beautiful foever ornaments might be in themselves, yet when improperly feet high, early in the spring I en- applied, and out of place, by affect-

ing to shew a taste, they betray ignorance of its true principles. that, under these difficulties, the fire,

As nothing would fland on the floping furface of the rock, without artificial means to flay it, Mr. Rudyard judiciously concluded, that, if the rock was reduced to level bearings, the heavy bodies placed upon it would then have no tendency to flide; and this would be the cafe even though but imperfectly executed; for the fliding tendency being taken away from those parts that were reduced to a level, the whole would be much more fecurely retained by the iron bolts, than if, for the retention of the whole, they had depended entirely upon the iron work; as manifestly appears to have been the case with the building of

Mr. Winftanly.

This lighthouse was built of wood, and finished in 1708. It continued forty-fix years, when, Mr. Smeaton tells us, about two o'clock in the morning of the 2d of December, 1755, when the light-keeper, then upon the watch, went into the lanthorn to fnuff the candles, he found the whole in a fmoke, and upon opening the door of the balcony, a flame instantly burst from the inside of the cupola. He immediately endeavoured to alarm his companions; but being in bed, they were not fo ready in coming to his affiftance as the occasion required .- As there were always fome leathern buckets kept in the house, and a tub of water in the lanthorn, he attempted as speedily as possible to extinguish the fire by throwing water upon the outfide cover of the lead. By this time, his comrades approaching, he encouraged them to fetch up water from the sea; but, as the height, at a medium, was feventy feet, this, added to the natural consternation attending fuch an event, would be the occasion of its being brought up but flowly. In the mean time, the flames, gathering strength every moment, and the poor man having the water to throw full four yards higher than his head, we cannot be furprifed,

that, under these difficulties, the fire, instead of being foon extinguished, would increase; and what put a stop to further exertions, was the follow.

ing circumstance.

As he was looking upward with attention to fee the direction and fuccess of the water thrown, quantity of lead, diffolved by the heat of the flames, fuddenly ruft. ed like a torrent from the roof, and fell upon the man's head, face, and shoulders: from this moment he had a violent internal fenfation, and imagined that a quantity of the lead had passed his throat, and got into his body. Under these circumstances it is not furprifing, fays Mr. Smeaton, they cealed from any further exertions to extinguish the fire, and in a state of horror and despair, to adopt the refolution of retiring from room to room, as the fire advanced over their heads.

These persons were however taken off the rock next morning by a box. The man on whom the lead sell lived twelve days; and when he wa opened, eleven ounces of that men were taken out of his stomach.

Mr. Smeaton was applied to, to erect the third lighthouse. That gentleman foon faw the necessity of building with stone. After laying down his plan, he went to Plymouth, and made his first trip to the Edystone in April, 1757. He was three years in constructing this curious building, which may be described in a few words. The rock, which flopes towards the west, is cut into horizontal steps, into which are dove-tailed, and united by a strong cement, Portland from and granite. The whole building, for thirty feet from the foundation, is a folid pillar of stones, ingrafted into each other. building has four rooms, one over the other, and at the top, a gallery and lanthorn. The whole is 80 feet high, and, fince its erection, has flood the fury of the elements without suffering the fmallest injury.

The work is ornamented with many plates well executed.

CHLOE ANGLING.

BY

THE LATE SOAME JENYNS, ESQ.

O'N yon fair brook's enamell'd fide, Behold, my Chloe stands! Her sagle trembles o'er the tide, As conscious of her hands.

Calm is the gentle waves appear,
Her thoughts ferencly flow,
Calm as the foftly breathing air,
That curls the brook below.

Such charms her sparkling eyes disclose, With such soft pow'r endu'd, She seems a new-born Venus, rose From the transparent flood.

From each green bank, and mosfly cave, The scaly race repair, They sport beneath the chrystal wave, And kis her image there.

Here the bright filver cel enroll'd In thining volumes lies, There backs the carp, bedropt with gold, In the funthine of her eyes.

With hungry pikes, in wanton play
The tim'rous trouts appear;
The hungry pikes forget to prey,
The tim'rous trouts to fear.

With equal hafte the thoughtless crew
To the fair tempter fly;
Nor grieve they, whilf her eyes they view,
That by her hand they die.

Thus I too view'd the nymph of late;
Ah, fimple fish beware!
Soon will you find my wretched fate,
And struggle in the snare.

But, Fair-one, tho' these toils succeed, Of conquest be not vain; Nor think o'er all the scaly breed Unpunish'd thus to reign.

Remember, in a wat'ry glass
His charms NARCISSUS spy'd,
When for his own bewitching face
The youth despair'd and dy'd.

No more then harmless fish enfnare, No more such wiles pursue; Lest, while you baits for them prepare, Love finds out one for you.

CHLOE HUNTING.

BY THE SAME.

WHILST thousands court fair Chloe's love,
She fears the dang'rous joy,
But CYNTHIA-like, frequents the groves,
As lovely and as coy.

With the same speed she seeks the hind, Or hunts the flying have, She leaves pursuing swains behind, To languish and despair.

Oh, ftrange caprice in thy dear breaft, Whence first this whim began; To follow thus each worthiefs beaft, And shun their sovereign man!

Confider, fair, what 'tis you do,

How thus they both must die,

Not furer they, when you pursue,

Than we whene'er you fly.

ON A CLOUD OF LOCUSTS.

FROM TRAVELS THROUGH TARTARY,

Deo plena funt omnia.

ALL, all is life, as well the dust we treads
As liquid air, thro' heav'n's vast concave spread;

Or all is death, as diff'rent forms they wear,

The earth, the waters, or the ambient air;

Or why is now the hemisphere o'ercaft, But from the East some pesilential blass, Charg'd with the seeds of reptiles form'd afar,

Threatens fair Plenty with destructive war. Perhaps, where Oxus rolls his stream along, By low-hung woods, unblest with reed, or fong.

fong,
First liv'd the air, impregnate all with
strife,

Or burst the shell, flow creeping into life; The infect-wing at first might there essay, Or on the earth begin their humbler

'Till quite matur'd, aloft in air they foar, And thus the hemisphere is darken'd o'er. O'er isles and kingdoms pass th' amazing gloom,

While boding nations tremble at their doom.

A S o'er the heath, amid his feel-clad Thanes, The royal Duncan rode in martial pride,

Where, full to view, high-topp'd with glitt'ring vanes,
Macbeth's firong tow'rs o'erhung the
mountain's fide;

In dusky mantle wrapp'd, a grifly form Rush'd with a giant's stride across his

ftorm, hollow thund'ring accents pour'd difmay.

Stop, O King! thy destin'd course, Furl thy standard, tern thy horse, Death besets this onward track, Come no further, quickly back,

Hear'st thou not the raven's crock? See'ft thou not the blafted oak? Feel'st thou not the loaded sky? Read thy danger, King, and fly.

Lo, you castle's banners glare Bloody through the troubled air; Lo, what spectres on the roof Frowning bid thee ftand aloof !

Murder, like an eagle waits Perch'd above the gloomy gates, Just in act to pounce his prey; Come not near,-away! away!

Let not plighted faith beguile: Honour's femblance, Beauty's fmile, Fierce Ambition's venom'd dart Rankles in the fest'ring heart.

Treason, arm'd against thy life, Points his dagger, whets his knife, Drugs his stupifying bowl, Steels his unrelenting foul.

Now 'tis time; ere guilty night Closes round thee, speed thy flight; If the threshold once be croft, Duncan! thou'rt for ever loft.

On he goes !- refultless fate Haftes to fill his mortal date: Ceafe, ye warnings, vain tho' true, Murder'd King, adieu! adieu!

THEATRICAL INTELLIGENCE.

HAYMARKET. The disturbance which on the first night; but on Saturday, proper than the presented on the opening this theatre, prevented the Presude being heard entrance to the different parts of the

house, the theatre was speedily filled by an audience in perfect good humour, and the currain drew up without a murmur or

a fingle hifs.

The Prelude, the beginning of which terms on the whimfical incidents attending the removal from Poor Old Drury—fuch as the lightning being half an hour anits way, a florm of hail being obliged to take shelter under an umbrella, a boy earrying the rock of Gibraltar on his boulders, with the red hot balls in his pocket. The triumphal car of Alexander the Great being pulled to pieces by a backney coach, and the coachman telling those who conducted it that he, was on his swn side of the way, and as for Alexander the Great, he might take the number of his coach if he pleased—was received with great applause:

Mr. Parions comes forward, and anmemores his refolution never to laugh or make other people laugh sgain, but determined, in order to be heard, to play nothing but Tragedy, with fuch readings as

were never before read.

Harlequin applies for employment, and being told, that the Manager is determined to truft to fense and sound for one featon, says, that as they may possibly want some affishance, he will savour them with one change gratis, and waving his sword, the scene changes to a most beautiful view of Parnassus and the Temple of Fame, with Apollo and the Muses descending from it, who all come forward, and, in song and recitative, promise their aid to the Company in their new situation.

the Company in their new fituation.

The Haunted Tower was again performed, with the Devil to Pay. Mrs.

Jordan, in Nell, difplayed the rich variety of her comic powers, and fung the fimple ballad, deferibing the fudden change of her fortune in a flyle of the most enchanting expression. The effect was all her own, for the had not the assistance of the orchestra. Moody gave an excellent picture of the Cobler. No disturbance has hap-

pened to impede the performance fince, and the audiences feem perfectly fatisfied with the additional accommodation they receive in return for their advanced price Nothing new has appeared at this theatre' and at

COVENT-GARDEN only two new performers; one made his first appearance, and we believe his last, in Osmyn, in the Mourning Bride; the other was Mr. Fawcett, son of the actor of that name, belonging to the Drury-lane Company. His style of characters is the same as the late Mr. Edwin, and in Caleb, in She Stoops to Conquer, and Jerry Sneak, in the Mayor of Garratt, has been well received.

The beautiful and superb theatre in the Haymarket, which was originally designed for an opera-house, and is now engaged by the Drury-lane company for two years certain, is perhaps one of the most beautiful places of amusement in Europe. It has on each side sive rows of boxes, and in front four rows of boxes, and a spacious gallery, the front of which is semicircular. To give our readers an idea of the size of this theatre, we are informed, that the pit is so spaced as to hold eleven hundred people commodiously, and the gallery upwards of nine hundred; the number of boxes is also very great.

To accommodate this theatre to the purposes of a playhouse, some alteration became necessary. The partitions which are usual between the boxes of an operahouse, are lowered, and the galleries and boxes supported by elegant gilt pillars. The stage is contracted, and stage doors receded, with boxes over them. There is not any one shilling gallery, and that part of the orchestra which is not wanted for a play-house, is converted into a feat communicating with the boxes. The fronts of the boxes are most elegantly painted with designs, on a blue ground; and, as the house is much better lighted than our theatres usually were, the whole has a

PARLIAMENTARY AFFAIRS.

most grand effect.

In the House of Commons, Wednesday, May 11, Mr. Minchin moved, that the House do now resolve itself into a Committee of the whole House, to consider of a bill for the improvement of the culture of hemp. The Hon. Member said, he did not purpose to detain the Committee long on the obvious advantages this country would derive from the culture of this very necessary article. The safety and prosperity of the country depended much on this article. The legislature, it was time, did not shew itself inattentive to this cir-

cumstance by the acts which had passed but he was forry to say that they did not answer the intent. Premiums had been offered for the importation of hempeight pounds per ton for a limited time-fix pounds and sour pounds for limited times. A premium of three-pence a stone had been offered for the cultivation of it in this country. Gentlemen might think that would have the desired effect, but it only served to verify the maxim that criting premiums would only produce tristing effects; for what was the return in one

year? Why, twenty tons; and what the importation in the same period? Twentyeigh thousand tons. It was not his intention to carry the bill through this feffion ; he only withed that the blanks might be filled up and the discussion of it re-

ferved till next leftion.

The order of the day being moved for the to-commitment of the Quebec Bill,

Mr. Hobart took the chair.

Mr. Pitt supposed it would be only neceffary to go into those clauses on which In a former debate a difference of opinion

feemed to arife.

Mr. Buffey faid he should certainly vote against the clause which went to the divifion of Canada into two provinces, unless be heard fome very convincing arguments in support of it.

Mr. Fox had his doubts under the Royal Proclamation in 1763, and the Quebec A& in 1773, how far prerogative was enabled to divide Canada into two pro-

Mr. Pitt thought it was necessary to examine into that. His Majesty's Royal Proclamation was read, in which it was flated, that those who went to Canada, under the faith of that proclamation, thould be indulged with laws which came as near the laws of the mother country as the nature of circumstances would admit. He did not conceive it possible that any objection could be flarted against the division. Inconveniencies certainly would arife, but in the choice of inconveniencies, it was beft to take the leaft; from cuftom, manner, habit, and language, it was na-tural to suppose that the anadianswere attached to the laws of France, which obtained amongst them at prefent; and it was plain that the American Loyalifts, from the circumstances of their migration to that country, would prefer the laws of England. It was the wish, no doubt, that the English laws should prevail; and he thought his Majesty's Ministers had purfued the most effectual step for that purpole.

Mr. Barke joined in this opinion; he thought it was best to give the Canadians Canadian laws, and the English English laws. The former were attached to their own laws from prejudice, custom, inguage, and education; it was best then to lay hold of this fecond nature, which was the furest hold, and far preferable to the opinions of those new legislators, who ran into the wildest regions of theory, of which we know as little as we do of the North-West passage, or the extremities of

Mr. Pitt protefled, that he was happy to find that the Hon. Gentleman was of his opinion.

Mr. Fox faid, the local division of the bill pointed out the political division; the is, that it was intended to give the English in the Upper Province the English law, and the Canadians in the Lower Province the Canadian laws. If this was not the object of the bill, he should be glad to be fet right : but, in doing this, were gentlemen fully fatisfied that the royal promife contained in the proclamation is 1763 was maintained to those who were allured under the faith of a treaty to fettle in Canada, and to embark in the conmerce of that country? If any gentlemn would take the pains to examine that proclamation, he would be convinced the there were allurements in it to induce the one and the other, but it was not left to theory, for the fact was, that it, had the effect; and it was allo another fact, the those who were allured to settle under the faith of that proclamation were stry well contented with it.

Mr. Francis wished to know, if the division in question took place, and the English were to be governed by the lays of this country, and the Canadians by their own laws, if it would not lead to perpetuate a French government; and if is,

how far that was politic and prudent.

Mr. Pitt faid, the object of the prefeat bill was to unite the inhabitants of the two Provinces, in hopes that when the Canadians law the good effects of the Esglish laws, they would, by degrees, affinilate themselves to them. Did gentlemes wish to force the English laws on a body of people who were ignorant of them, and who preferred laws with which they were as quainted? Time and events, he hapel, would bring about the object of the bill, and under thefe circumstances, he trulet it would meet the wishes of the majority of that House,

Mr. Sheridan thought it necessary to know how far the bill would be acceptable to those for whose benefit it was pro teffed to be intended, before it was lest over to be finally executed. He was furprized to find that the petitions, from which the opinion of some part, at leas, of the Canadians, might certainly be learned, had not been noticed by the Hos. Gentleman in framing the bill, or in stcommending it to the House. A petition, he understood, had been transmitted by Lord Dorchefter in March 1790, and pre fented by Mr. Limburner, the agent for the Canadians in London, who had an interview with Mr. Grenville upon the su-ject in April, and another in June, the result of both which were unfavourable to the petitioners

The contents of this petition he recom mended to the ferious attention of the

Minister, and wished that when the bill had been perfected as far as possible by the le of it, a copy should be transmitted to Canada, that the fenfe of the principal inhabitants might be collected upon it, and Parliament be thus enabled to decide with equity between the wishes of the people and the alledged necessities of goremment.

Sir J. Sinclair apprehended that there would be a division in the Province, were the present clause to make part of the bill; and therefore moved an amendment, which was agreed to without a division.

The clause for establishing a Legislative

Council being read,

Mr, For objected to the mode by which it was proposed to be formed. He thought, beyond a doubt, that this Council should be composed of a certain mixture of Mosarchic, Aristocratic, and Democratic power, and he was not unwilling to fay, that the Aristocratic portion was abso-lately necessary to this Province. But how was this Council to be formed ? Was refort to be had to family diftinction, or to wealth, or to both ? If family diffinction was unnoticed, one of the barriers against the degradation of vice was taken away, and a very powerful incentive to virtue would be lost. There would also be a degree of injustice in it to individuals ; for, he was of opinion, that where the public received advantage, the public ought to hew refpect.

Mr. Fox recommended, that the Legislative Council should be elected, and that there should be a qualification both for the

electors and elected.

This amendment was negatived without a division.

In the House of Commons, Thursday, May 12, the House resolved in a Committee on the farther confideration of the motion for leave to bring in a bill to encourage the growth of hemp; granted a bounty for the culture of hemp at the rate of 61, per ton, and 20s, for every acre of waste ground converted to this purpose.

Mr. Grey faid, it was unnecessary to flate the case of those unhappy persons in whole behalf he came forward; those, who were confined in gaol, without either the mesus of discharging their debts, or the polibility of redeeming them. The bare mention of fuch diffrefs, sufficiently fuggested the necessity of relief. He would therefore move, "That a Committee be appointed to enquire into the effects of imprisonment for debt."

The Attorney-General highly approved of this motion, which tended to embrace the whole mass of information.

A Committee was appointed to enquire into the effects of imprisonment for debt. In a Committee of the whole House, on

the Quebec bill, proceeded to read the clauses from where they left off last night. On the clause for appointing the returning officers, a fhort converfation took place between Mr. Fox, Mr. Pitt, Sir John Sinclair, and others; on that appointing the Houses of Assembly for Up-per and Lower Canada, it was proposed to fill up the blank, fixing the number of the Allembly for Upper Canada with the word lixteen.

Mr. Fox objected to the number-He contended, that after fo much had been faid about obtaining a proper ariftocracy for that colony, on a former night, they were not now to lofe fight of giving it's proper share of democracy likewise, which was allowed on all hands to be requifite if we meant to form a government advantageous for that country; and how fix-teen people, in fo wide a diffrict, could form a popular Assembly, he was at a loss to find out; and certainly we must be strangely mistaken indeed, if we were to call this mode of giving a popular Affembly to the Province of Canada any re-femblance to the British Constitution, which was held out to them as the example that all parties wished to follow in fettling their new government. For his part, he confidered fixteen as no popular reprefentation at all, and no ways proportioned to the ariflocratic body, which he underflood it was proposed to give themhe therefore wished to make an amendment, by increasing the number-that part of the Clause passed-and he had the same objection to the number of thirty propoled for the Assembly for Lower Canada, when it was stated that there were ten thousand inhabitants in Upper Canada, and one hundred thousand in the Lower Canada, which he thought a very extraordinary and improper proportion between the electors and the elected, between the people and their representatives.

Mr. Pitt contended, that though there might be fuch a number of inhabitants. still they were not all to be considered as electors; and likewise stated, that the clause mentioned for Upper Canada a number not less than 16, and for Lower Canada, a number not less than 30; but that the Assemblies were not limited to these numbers, and might at a future pe-

riod be increased.

The duration of the House of Assembly was fixed for four years, instead of feven, as originally proposed; and the right of appeal, instead of being first to the Privy. Council, and then to the House of Lords, was reffricted to the Privy Council only.

Mr. Fox objected to the mode of providing for the maintenance of a Protestant Clergy by appropriating a feventh of our future grants of lands; and also to the

on of the fion ; the he Englis glish laws Province s pot the lad to he were gen

oyal promation is who were y to fettle the comentlema that pronced that aduce the

recon Tinifler, diffinction in applying this maintenance in favour of one fet of Protestant Clergy in preference to another; and stated his reasons at lengh, as in his speech on the re-commitment of the Bill. The clause was passed in its original state.

In the house of lords, on Friday May 13, Lord Portchester moved, that copies of the last dispatches respecting the progress of the war in India, might be laid before the

nouse.

Lord Grenville refished the motion. All the information which was necessary, had appeared through the medium of the public prints, in a letter of Colonel Floyd to an officer of diffunction in England; and the reason why that letter did not appear in the Gazette, was because it did not come to England officially. The question was

negatived without a division.

In the house of commons, on Friday May 13, the Speaker thought it his duty to mention, that the bill now about to be considered, had originated in the Lords; that it purported to amend and regulate so much of an Act of the 6th of Queen Anne as related to the distribution of rewards for the conviction of felons; that this being a Money Bill, such an alteration had always been deemed an infringement of the rights of the commons, who had been accustomed to resist any law which originated with the lords on the subject; he therefore wished to be directed by the house on the occasion.

A fhort conversation ensued, after which the further confideration of the bill was postponed till this day three months.

The Master of the Rolls, after stating a variety of frauds which had been committed in confequence of the imperfection of the law relating to rewards for the conviction of felons, recommended to the house to fanction a bill, empowering the Judges to decide on the merits of the convictions.

 That leave be given to bring in a bill to regulate the distribution of rewards for the conviction of felons. Ordered.

a. That leave be given to bring in a bill to admit those convicted of Petty Larceny as competent evidence. Ordered.

as competent evidence. Ordered.

In a committee of Ways and Means,
Mr. Hobart in the chair, Mr. Pitt rofe to
offer his promifed resolution concerning
promissory notes, receipts, and bills of exchange. The first object respected the alteration on the existing duties; the next
object adverted to what these existing duties were:

All bills of exchange, payable on demand, under tol. incurred only a duty of ad, which he proposed to alter in the following manner: That although bills not exceeding five guineas should remain at the old duty, yet those from five guineas to thirty pounds should pay a stamp duty of 6d. This regulation was not, however, meant to extend to bills not psyable on demand, which, whether under five guineas or not, were to pay 6d.

Those from gol. to sol. the duty of gd.

In the last duty, there was no difference from the former, excepting that the sum is now limited from 501. to 1001. whereas in past periods there was a duty of one fail. ling only on bills of 501, and upwards.

Bills of 10el, to 200l.

Bills of 200l. and upwards

Although he might, perhaps, be judified in a farther increase of duties on bills of larger sums, yet that modification was not deemed necessary at present.

On promiflory notes, which were pay, able at two places, and re-iffued after toing paid at the first; transmitted into the
country as remittances; and thus produced
the effects of bills of exchange, which are
only paid once, confequently materially,
injure the revenue, he proposed the following duties;

Those re-issued for five guiness, a duty of sixpence.

From five guineas to 30l. and not ex-

Notes not having this double flamp were

to be prohibited.

In the tax on receipts he would propole an alteration in the third flage. Infleed of 4d. a duty of 6d. should be imposed on

all receipts exceeding 501.

He then made fome allufions to the maner in which the receipt tax had been evaded; faid that it was intended to bring forward certain regulations for the prevention of those frauds in future; but what that plan was he did not now mean total plan. He concluded by the usual motios, that the old duties should cease; and proposed certain resolutions, in the maner already described, for the increase of those duties.

In the house of commons on Wednelday May 18, The Chancellor of the Exchapur presented a message from the King, viz. "GEORGE R.

"His Majefty finding that the additional charges incurred on account of the effect of the pounger branches of the Royal Family, cannot be defraged out of the monies applicable to the purity pofes of his Majefty's civil government, is under the needfity of defiring the afficiency of Parliament for this purpose, and his Majefty relies on the affections of his faithful commons that they will make such provision as the circumstance may appear to them to the

The Chancellor of the Exchequer moved, That the faid meffage be taken into confideration on Friday next, and that it be referred to the committee of supOn the motion of the Chancellor of the Integer, the House resolved into a Com-mire of the whole House, to consider of ways and means for raising the supplies mated to his Majesty, Mr. Hobart in the chair. The feveral accounts of income and expenditure that had been presented to the mmittee, were referred to the faid Comsittee. The Chancellor of the Exchequer pour of laying before the Committee is as fhort and diftinct a manner as he could, the articles of expenditure, and of Ways and Means, of the present year, sening from them the fum of 3,133,000l. which had been feparately voted for the espece of the armament of last fummer, and also for defraying the expence of 6000 feamen. These be wished to leave out of this confideration, for the fake of coning the attention of the Committee to the other articles which he conceived necollary to lay before them. The first head of expence was the Navy. and here he should only consider the expeace of 18,000 feamen, the additional foro having been formerly provided for. Expences of 18,000 Seamen £. 936,000 Orleance of the Navy 689,000 Repairs of the Navy 506,000 Total 2,131,000 ARMY. The fum for the Army amount-1,853,000 ORDNANCE. Navy as before flated Army Ordnance Deficiency of Land and Malt Deficiency of Grants	2,131,000 1,853,000 443,000 400,000
Sum total of the Supplies	5,728,000
WAYS AND MEANS. The Chancellor of the Excheque fhould next proceed to confider and Means, for raising this sup millions. He calculated the land and malt, as usual, at Surplus of last year's taxes Amount of the lottery Growing produce of the confoli- dated fund for the next twelve	r faid, he of Ways ply of five 2,750,000 303,000 306,000

months, taken on an average of the laft three years 2,110,000
Balance of accounts - 154,000
Taxes of 1789, tobacco regulations, &c. + 120,000

From this fum is to be deducted three quarters annuity to the Duke of Clarence 9,000

By comparing the fum total of the supplies with the sum total of the Ways and Means, it would be seen that the last exceeded the first by the sum of six thousand pounds.

He knew nothing more that was neceffary for him to add on the subject, and
did not think it necessary to detain the
Committee any farther by going into a
discussion of the state of our sinances.
They had received a very able and accurate
report from the Committee that was appointed to enquire into that subject, and
they would have an opportunity of considering this subject by itself much better
than they would on the present occasion.
He had no doubt but that every gentleman
would examine very attentively the nature
and contents of that report, and he stattered himself that no one would examine
it without a great degree of fatisfaction.

The Chancellor of the Exchequer concluded with moving agreeably to the above statements.

Mr. Sheridan agreed with Mr. Pitt in the encomium he paid to the last Revenue Committee. He was sensible of the difficulties of their task, and of the great expedition with which, as far as in them lay, they accomplished it; but however, from their report, and from what he had just heard, he must draw the most unfavourable conclusions, for it had only served to fortify the opinion he had long entertained on the subject, viz. the ill administration of the susaces, and the deter-

594.000

Total .

mination of Ministers to increase the expences in proportion as the income had encreased. However, he did not mean pences in proportion as the income had, encreafed. However, he did not mean then to trouble the Committee long, hoping that a day, would be fet apart for the particular inveftigation of fubjects of fo great importance. The happy period, 1791, had arrived, in which the favorable predictions of the Committee of 1786 were to be effablifhed. The flatements even of the Right Hon. Gentleman opposite to him, clearly evinced the fallacy of these calculations. The principal points which had appeared from these statements, and what the general tenor of his arguments went to eftablish, were, that the ordinary peace establiftment had, in the prefent year, and was likely to be, increased very near half a million figure the Committee of 1786 made their report. Nor did he think the reasons of such increase were fatisfactory. In a line of general affertion, intermixed with some statement, he declared the report of the Committee of 1786 to be fallacious, the prodigality of government to be ex-ceffive, and that the present state of the finances wore the most unfavourable aspect. Mr. Pitt replied.

The refolutions which were moved by

put and agreed to.
In the House of Commons, Thursday, May 19, Mr. M. Angelo Taylor wished to know if it was intended to make any provision for the Duchels of Cumberland, fuitable to the rank of that illustrious per-

Mr. Pitt replied, that he had no fuch communication from his Majesty, and that, under such a circumstance, he did not think himself warranted to propose any

Mr. Benfield faid, he rose to pay that tri-bute of approbation to the candour and exertions of the Committee of Finance to which he thought they were entitled, and to the Right Hon, the Chancellor of the Exchequer, for his readiness in appointing them; but he thought it would be ftill more fatisfactory if they had fet down the unfunded as well as the funded debt; we should look our affairs in the face, and be made perfectly acquainted with our real fituation.

Mr. Dudley Ryder answered, that the tinfunded debts were expressly stated in the

In the house of commons, on Friday May 20, Mr. Fox role to make his promiled motion for the houle to resolve itself into a grand committee on the courts of In bringing this bulinels before the house he did not expect to have it imputed to him that he meant to charge any thing faulty in the administration of justice, when it was only his intention to com-plain of defects which had crept into the

courts, and which in his opinion required. the interference and correction of the houle, to render fronger meatures unne-cellary. He said, he mould on that day bring more than one point forward, the first would however be, what he considered the most important, namely, the conduct of the courts on trials for libels. Whoever, he faid, made an observation on the improvement of the world, and on the general spreading of science, must acknow ledge that it was owing to the diffusion of the liberty of the press, for which he declared himfelf to be a warm advocate, though he was not a defender of its h. though the declared himself to be against all previous restraints, and ob-ferved that in those times when men were found unwife enough to lay on such re-ferants, they were found only to operate as a check on the real liberty of the pref, but could never prevent its licentiquises. The right honourable gentleman then es tered particularly into the case of Mr. Les. ford, featenced to a year's imprisonment, and the pillory, for a paragraph in the He-rald, a fentence he declared to be mordnately severe. Having gone through this cale, argoing that the paragraph was set libellous in the manner stated, he went into the confideration of who fhould be the judges of the inucudoes and inference flated to be contained in the libel, the udge or the jury. - He contended that the jury ought to decide on both points; for if a plain man on a jury was capable of diftinguishing the words of the inventor in a libel, he would certainly be capable of drawing every inference of fact from facts ; for it would be strange indeed to tell him he was able to make out an inuendo though from the invendo he was to be told that he could draw no inference. He quoted a confiderable number of p cedents to effabiith the doctrine of right of a jury to decide on law and fall, reprobating it as beneath the proud fi tion of an Englishman to give a verdical guilty, before an enquiry was made to prove that guilt, and thereby leave it is future enquiry to be instituted to find w ther that which was was voted to be a libel contained the requifites to render it fur or whether it might not be innocent, w even meritorious .- The next point wished to fix the attention of gentlemen ! was the proceedings of the King's Bench on Quo Warranto proceedings, which fore were of opinion the judges had a dilcretionary power to iffue, upon different plications: for this however, but on wh right he knew not, the Court of King Bench during the time of the late veneral and worthy Chief Justice, had laid down a rule that no Quo Warranto informatica should be issued against a Corporation of twenty years standing, and the prefest

that lowered that term to fix; this ligration he objected to, as having been made retrospectively instead of prospecially by which those who had trusted to be former rule might have been desired. he former rule might have been deprived of the means to proceed against those when they had sufficient time for according to the former rule. He next hiered upon this subject, that the Attorsey General, by virtue of his office, had a night at all times to iffue a Que Warrante, de confequence of which might be, in fer of contested elections, that an admiincion might disfranchise those who settl against them, by their Quo Warrante proceedings, though those that voted for evernment might be equally illegal corperturn, whom however it might not be in the power of those who withed it, to disfranchise, they probably having been six m corporators. He wished therefore either to take away the right from the Atmacy General, or to limit it in the fame way as it was limited in the King's Bench. He confidered the two main fprings of the conflitution to be the representation of the people, and the right of their trial by jury; day other part of the conflitution should ared, it might be remedied, but if the min fprings were destroyed, the whole claded by moving that the grand committee on courts of justice do fit on Tuesday, to eredings in cases of Que Warranto.

Mr. Erfline feconded the motion.

The Attorney General agreed that fome measure ought to be adopted; he could not however agree to the fitting of the grand committee, as that would induce the peo-ple to imagine that the conduct of the judges was cenfurable.

Mr. Jekyll wished the motion to be agreed to for the house to resolve itself into a grand committee, which could not, after what had been faid, be confidered as in any way reflecting on the judges.

The Chancellor of the Exchequer hoped there would be no difference of opinion on the general subjed before them, and that no difference might be fought in the mode for obtaining an object defirable to all. He declared that, as far as he had con-fidered the subject, he fully agreed, with what had been so ably stated by the Right Hon. gentlemen on the province and duty of a juryman; with them he also declared his opinion to have been in opposition to the practice for a long time followed in the Courts. He was against going into the Committee, conceiving the question not to be what has been law, but what shall in future be the law.

Mr. Fox withdrew his motion, and afterwards moved, " for leave to bring in a " bill to remove all doubts respecting the " rights and functions of Juries in crimi-" nal cases." And,

" For leave to bring in a bill to explain " and amend the Quo Warranto Act."

FOREIGN INTELLIGENCE.

Confantinople, August 22.

THE plague continues here with no ma-terial variation, but is entirely ceafed at Smyrna and Salonica, where the thipping are again provided with clean bills of

Madrid, Aug. 22. The fiege of Oran is paned with redoubled vigour. Three foreign vessels lately entered a neighbourag port, where they landed many cannon, all a confiderable quantity of powder, implies a want of vigilance in the Spanish adron appointed to cruize in that lati-

It is, however, to be remarked, that they are far from being favourable to the French, whom they call vile Lu-

During

and voluntary acceptance of the Constitution. The people of Paris feem not only fatisfied of the fincerity of his Majesty's intentions, but it is quite become the ton to forget his preceding attempts, in the full persuasion that he was always in himself well inclined to a change of Government in favour of liberty, except when led aftray by the Ariflocrats.

Bohemia, Sept. 4. The homage of the kingdom took place in the following man-

About nine o'clock in the forenoon, his Majesty went from his apartments to the Court Chapel in the Oratory, preceded by pages, the States of Bohemia and Moravia, the Clergy, Chamberlain, and Privy Coun-fellors. These were followed by the first fellors. Maitre d' Hotel, and the Upper Lord Marshal, bearing a naked sword before his Majesty, who came next in the procession, with his hat on, attended by the Captain of

The Emperor being arrived in the Ora-The French king has fent official notice tory, the Upper Lord Marshal put the to all the Courts of Europe of his formal fword on a table, covered with red velvet, During the High Mass, the Book of the Gospel was given to his Majesty to kis.

After High Mais, the Upper Lord-Marflail took the fword again from the table, and his Majetty, attended by the fame retinue, went to the Great Hall, where there was a throate two steps high, on which was a richly decorated arm-chair. His hisjety fat down with his head covered. Opposite the throne a chair was erected, from which the hereditary homage was read, in the Bohemian and German languages. The Bohemian oath was first read, and then the German.

The Secular States held up three fingers of the right hand, and the Spiritual put

their right hand on their botom.

After the oath, the States thanked His Majelly with a low bow; upon which His Majelly rose from the throne and went with the same attendance to his a ariments.

Wasfaw, Sep. 7. A few days fince the Bailli de Cuber had an audience of his Polish Majesty, and prefented to him his credentials as Envoy Extraordinary and Minister Plenipotentiary from the Court of Madrid, in the 100m of M. de Normandez.

Madrid, in the 100m of M. de Normandez.

Vienna, Sept. 7. The ratifications of the
treaty of geace, and of the convention between his Imperial Majefly and the Otto
man. Poste, were exchanged on the agd.
ultimo, at Siftove, by the Auftrian and
Turkish plenipotentiaries, in due form.
And on the grh instant Sir Robert Murray
Keith, his Britannick Majefly's plenipotentiary at the above Congress, returned to
this city.

Frankfort. Sept. 10. Their Imperial Majesties made their entrance into Prague on the 3th of August. They alighted in the Court of the Chapel of St. Adalbert, where the Archbishop pronounced a discourse in Latin, to which his Majesty replied in the same tongue. Their Majesties having kneeled down, kissed the cross presented to the Church by Charles the Fourth, which was presented to them by the Archbishop. After this ceremony their Majesties proceeded to the church, and from thence to the cattle.

Paris, Sept. 14. This morning his Most Christian Ma.ety came to the national Assembly in his state coach, attended by his Ministers, and having taken the oath prescribed by the new Constitution, he returned to the Palace of the Thuilleries, shrough the Garden, on foot, attended by the Members of the Assembly.

A general illumination and other rejoicings have taken place throughout the city

on the occasion.

Extradiof a Letter from Paris, Sept. 15.

The grand event is path, and the Confluction of France has received the Signature of the King. The anxiety of the public to be prefent at the ceremony was

fo great, that hundreds remained all night in the Hall of the Assembly. When I went at feven o'clock in the morning, found all the galleries full to overflowing; but I was, by good interest, and the friendship of the commissioner, fortun enough to get a place in the Tribune of Suppliants, exactly opposite to the President, and not more than ten or twelve yarde diftant ; fo that I commanded a full view of the scene. Such of the members of the new legislature as had arrived in town, were placed on the heretoforen-cant benches of the party droit, and the politeness of the Assembly yielded in the eager curiofity of the people, by admitt numbers of foreigners, and others, to for in the body of the Affembly-in all then in the body of the Alternoty—in an unrecould not be fewer than 3000 finagen prefent. The box fet apart for the familiar of the Logographe, close to the Prefident chair, was on this occasion fitted up for the Prince Royal Mahar the Queen, the Prince Royal, Make Royal, and the ladies who attended the The writers for this valuable Journal wite accommodated with places for the dayin the body of the Hall; for fo properly terests of the people, that, for the fakes publishing correct accounts of the procesings, the respectable Papers have be and places allotted to them, that they my write the accounts on the fpot.

The ceremony of the Proclamation of the constitution commenced at nine added. A body of national horse led the proclion—two regiments of soot followin ranks of fifteen abreaft-two regiments formed, three abreaft, in opposite columns, and left a wide space in the midst for the Mayor of Paris and the Municipal Corps, with a numerous band of muficians and the procession was closed by two rements, fifteen abreatt, and a bone. The Proclamation was made by a Musicipal officer—first—opposite to the Rutel de Ville—next in the Carousal, op-sente to the palace of the Thuilleries sext at the gate of the Feuillans, which leds to the National Affembly—fourthly, in the Square of Louis XV. and the procession then crossed the New Bridge of Louis XV. and proceeded to the Field of Interation. Thither all the bodies invited to affift in the ceremony had pre-vioudy repaired, and had taken their places, police to the Altar of the Nation, which as ornamented nearly in the fame manher as on the 14th of July last.

Paris, Sept. 21. The following are the

Paris, Sept. 21. terms in which the general amnesty, with stiped to the events of the Revolution, s decreed :

The National Affembly, confidering that the object of the French Revolution was to give a Constitution to the Empire, and that therefore the Revolution ought to end at the period when it has received

his Majefty's acceptance :

Confidering that, by how much the more culpable it will henceforth be to refift the constituted authorities, so much the more honourable it will be to forget these marks of opposition testified against the general will; and that the time bath at length arrived when diffentions ought to be extinguished by a general fenti-ment of patriotism and of fraternity for each other, and affection for the Mo-narch, who has himself given the example of this generous oblivion :- It is decreedArt. 1. That all profecutions, judgments, and proceedings, which have the Revolution for their object, shall be irrevocably abolished.

No officer of the police, judge, &c. shall commence any fresh prosecution.

Art. g. The King shall be requested to order the Minister of Justice to draw up a list of those at present confined on account of the Revolution.

Art. 4. That a general amrefty shall take place in regard to all military men, accufed or convicted of military offences fince the ift of June, 1789.

Art, 5. There shall no longer be occasion for any paffports, the ule of which was only adopted during a troublefome period; and every French citizen is hereby empowered to enter or leave the kingdom, according to his inclinations.

Vienna, Sept. 23. On the 17th of this mouth the Deputies from the States of Bohemia had a folemn audience of their Majesties, during which they prefented to the Emperor, in a golden plate, the usual gift of 100,000 florins, and 70,000 ducate to her Majesty the Empres,

Berlin, Oct. 4. On Saturday laft the marriage of her Royal Highness Princels Wilhelmina of Pruffia, with his Serene Highness the Hereditary Prince of Orange was folemnized with the same state as that of his Royal Highness the Duke of York with the Princels Frederica of Pruffia

Hague, Od. 4. We learn from Petersburgh, that the Empress of Russia has defired the French Ambaffador to quit that Court; and the latt letters from Madrid mention, that the King of Spain has forbid the Parifian Minister from appearing at that

It is generally imagined that Ruffis, in conjunction with Sweden, will make a vigorous attempt in favour of the Ariftocratic party in France, in which they will most likely be joined by the Emperor, and probably by other Powers, either in the field or the Cabinet; in fort, the moment feems approaching for the Powers of Europe to unite in endeavouring to reftore energy to the Government of France, and confequent tranquility and prosperity to its inhabitants.

Paris, Od. 14. The Protestants had yesterday a folemn thankfgiving in the church of St. Thomas du Louvre, for the completion of the Constitution. The Municipality and the Directory of Paris attended. Before the fermon, which was preached by M Morton, an hymn was fung. confifting of verfes felected from the works of various poers, and paffages from the pfalms, fo arranged as to have all the appearance of a regular composition. The whole fervice was conducted with equal majefly and devotion. It was truly gratifying to ob-

ferve fincere Catholics join in praising God with Protestants, whom their deluded anceftors would have thought it doing God fervice to burn. Surely we must admit, that Christians of different seets must have been incited to perfecute and murder one another by the interested delusions of their religious pallors, or the abfurd inflitution of their political rulers, for where they are left to the honest suggestions of their own hearts, we find them tolerant, charitable, and firougly impelled to mutual love.

Edinburgh, Od 10. The wind blew very hard all latt night from N.E. accompanied with a very heavy fall of rain, which caused a great speat in the harbour. A number of vellels broke from their moorings, but luckily no material damage was done to the shipping, except amongst the boats, some of which were driven out of the harbour, and others sunk and otherwise damaged. At prefent the square lighter for cleaning the harbour lies under the bottom of one of the floops, occasioned by the heavy fpeat.

Glafgow, Od. 11. In confequence of very beavy rains which we had for the two preceding days, the river Clyde yesterday overflowed its banks, and rose to such a beight as to lay all the lower part of this city feveral feet under water. The furniture and goods in the houses which the water reached have been very much damaged; and as the harvest is not yet quite got in in this country, great quantities of cut corn have been swept away by the lands overflowed by the river.

The water rose so high as to reach the cells of the Mad-house. The instantaneous effed which the dread of the water had upon the lunation was very remarkablethe whole of them, even the most furious, were rendered quiet and tractable, and allowed themselves, trembling like children, to be conducted to apartments on the upper flory, where they remained calm and peaceable, as long as the Court-yard re-

mained covered by the water.

MARRIED The Right Hon. Lord Grantley, to Mifs Midgley, eldelt daughter of the late Jopathan Midgley, Eiq. of Beverley, in Yorkshire, and niece to the late Lady Denifon.

DIE D.

His Excellency Le Marquis de la Luserne, Ambassador from France to this Court. He had laboured under difeafes for fome years, on account of which he drove about to most of the watering places in the kingdom, but in the latter end of July, be found his diforder coming upon him very fast, and, receiving no relief from the Bath waters, resolved to take a tour through England for the air. In this tour he was ftopped at Southampton, where he paid the last debt of nature. The palfy had affected him so much, that for fome time he was deprived of the ule of his legs and right arm, fo that he was fed by a nurse, but his Excellency still retained his senses until a few hours be-The noble Marquis, a fore his death. few days before his dissolution, had some apparent symptoms of recovery, the blood having gained circulation in the right thoulder.

Rear Admiral John Harrison, who was first Captain under Sir George Pococke, in all the engagements with the French

A 100 2 10 215

Admiral Monfieur D'Ache, and at the taking of the Havannah. Soon after which he lost the entire use of one side by a stroke of the palfy; the consequence of excessive satigues of mind and person, in the arduous fervice of his Sovereign and his country.

Sir Herbert Mackworth, Bart. death was occasioned by a thorn that entered his finger, which, not being extracted in time, induced a mortification that proved fatal in a very few days.
